1.3 Before you start

1.3.1 Copyright

This document may be duplicated and distributed only with the express permission of Siemens, and may be passed only to authorized persons or companies with the required technical knowledge.

1.3.2 Quality assurance

This document was prepared with great care.

- The contents of this document are checked at regular intervals.
- Any corrections necessary are included in subsequent versions.
- Documents are automatically amended as a consequence of modifications and corrections to the products described.

Please make sure that you are aware of the latest document revision date. If you find lack of clarity while using this document, or if you have any criticisms or suggestions, please contact the Product Manager in your nearest branch office. The addresses of the Siemens Regional Companies are available at <u>www.buildingtechnologies.siemens.com</u>.

1.3.3 Document use/request to the reader

Before using our products, it is important that you carefully read the entire documents supplied with or ordered within the products (equipment, applications, tools, etc.).

We assume that persons using our products and documents are authorized and trained appropriately and have the technical knowledge required to use our products as intended.

More information on the products and applications is available at:

- On the intranet (Siemens employees only) at <u>https://workspace.sbt.siemens.com/content/00001123/default.aspx</u>
- From the Siemens branch office near you
 <u>www.buildingtechnologies.siemens.com</u> or from your system supplier
- From the support team at headquarters <u>fieldsupport-zug.ch.sbt@siemens.com</u> if there is no local point of contact.

Siemens assumes no liability to the extent allowed under the law for any losses resulting from a failure to comply with the aforementioned points or for the improper compliance of the same.

1.4 Target audience, prerequisites

This document assumes that users of the

RDF800KN../RDF800KN/VB/RDD810KN.. thermostats are familiar with the ETS and/or Synco ACS tools and can use them.

It is also assumed that these users are aware of the specific conditions associated with KNX.

In most countries, specific KNX know-how is conveyed through training centers certified by the KNX Association (see <u>www.knx.org/</u>).

For reference documentation, see section 1.2.

1.5 Conventions used in this document

Throughout this document, parameters are specified as **P**[*parameter number*]. For example, P30.

1.6 Glossary

The inputs, outputs and parameters of an application can be influenced in various ways. These are identified by the following symbols in this document:

Parameters identified by this symbol are set using ETS.

Parameters identified by this symbol are set using ACS.

The setting of RDF800KN../RDF800KN/VB/RDD810KN.. parameters is only supported by the following tool versions:

- ETS4 or higher
- ACS version 8.28 or higher

Inputs and outputs identified by this symbol communicate with other KNX devices. They are called communication objects (CO).

The communication objects of the RDF800KN../RDF800KN/VB/RDD810KN.. room thermostats work partly in S-mode, partly in LTE mode, and partly in both. These objects are described accordingly.

A list of the parameters is shown in section 3.14.

2. Summary

2.1 Types

Product no.	Stock no.	Application	Operating	Control outputs		Suitable for
			voltage	On/Off	3-pos	
RDF800KN	S55770-T350	Fan coil, universal heat pump		2 ¹⁾	1 ¹⁾	Round or square conduit boxes
RDF800KN/VB	S55770-T429	Fan coil, universal heat pump	AC 230 V	2 ¹⁾	1 ¹⁾	Round or square conduit boxes
RDD810KN	S55770-T444	Heating		1 ³⁾	-	
RDF800KN/NF ²⁾	S55770-T335	Fan coil, universal heat pump		2 ¹⁾	1 ¹⁾	Square conduit boxes ²⁾
RDD810KN/NF ²⁾	S55770-T336	Heating		1 ³⁾	-	

¹⁾ Select: On/Off or 3-position.

- ²⁾ Mounting frames are not included and must be ordered separately. See section 2.7.
- ³⁾ On/Off output with potential free input from AC 24...230 V

2.2 Ordering

- When ordering, please indicate product no., SSN no. and name: For example: RDF800KN (S55770-T350) room thermostat.
- Separate mounting frames must be ordered for RDF800KN/NF and RDD810KN... installation (see section 2.7).
- Order valve actuators separately.

2.3 Functions

Use of RDF800KN..,
RDF800KN/VBFan coil units using On/Off or modulating control outputs:
• 2-pipe system

- 2-pipe system with electric heater
- 4-pipe system

Chilled or heated ceilings (or radiators) using On/Off or modulating control outputs:

- Chilled or heated ceiling
- Chilled or heated ceiling and radiator/under floor heating

Compressors using On/Off control outputs:

- 1-stage compressors in DX- type equipment
- 1-stage compressors in DX- type equipment with electric heater

The room thermostats are delivered with a fixed set of applications. The relevant application is selected and activated during commissioning using one of the following tools:

- Synco ACS
- ETS
- Local DIP switch and the HMI

Use of RDD810KN...

Heating using On/Off control outputs:

- Floor heating/radiators
- Wall-hung boilers

	In addition for RDF800KN, RDF800KN/VB: • On/Off or 3-position control outputs (relay) • Output for 1- or 3-speed fan • Automatic or manual heating/cooling changeover In addition for RDD810KN: • Potential-free contact (SPDT) for heating
Type of mounting/ suitable conduit boxes	 RDF800KN, RDF800KN/VB, RDD810KN: Round CEE/VDE conduit boxes, with minimum 60 mm diameter or recessed square conduit boxes with 60.3 mm fixing centers, minimum 40 mm depth RDF800KN/NF and RDD810KN/NF: Recessed square conduit boxes with 60.3 mm fixing centers, minimum 40 mm depth
Functions	 Room temperature control via built-in temperature sensor or external room temperature or return air temperature sensor Operating mode selected using touchscreen Temporary Comfort mode extension Display of current room temperature or setpoint in °C or °F Minimum and maximum limitation of room temperature setpoint "Screen lock" function: Unlock, total lock and setpoint Two multifunctional inputs, selectable for: Window contact Presence detector External room temperature or return air temperature sensor Fault input Monitor input for temperature sensor or switch state Sensor for automatic heating or cooling changeover (RDF) Dew point sensor (RDF) Electric heater enable (RDF) Floor heating temperature limitation (P51) Reload factory settings for commissioning and control parameters Wizard function for easy commissioning using the HMI

•

•

٠

Backlit display

AC 230 V operating voltage

- · Changeover between heating and cooling mode (automatic using local sensor or bus or manually)
- Selection of applications using the DIP switches or the tool

Operating modes: Comfort, Economy and Protection

- 1- or 3-speed fan control (automatic or manually) •
- Advanced fan control function, for example, fan kick, fan start, selectable fan • operation (enable, disable or depending on heating or cooling mode)
- Purge function with 2-port valve in a 2-pipe changeover system
- Reminder to clean fan filters (P62)

8/94

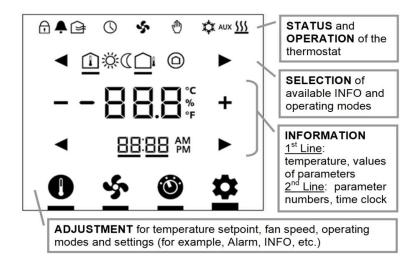

Features

2.4 User interface

Touchscreen display

The RDF800KN.., RDF800KN/VB and RDD810KN... room thermostats have a touchscreen (segment type) user interface. The thermostat displays only the room temperature value or any alarm in Screen Saver mode.

To start any operation or change settings, touch the screen to display all available operating icons available in Selection Screen mode. Ten seconds after the last operation, the thermostat returns to Screen Saver mode.

Status	icons:		
\mathbf{f}	Screen lock	€	Manual override
	Alarm/Service reminder	₩	Cooling active
\bigcirc	Scheduler via bus	<u> </u>	Heating active
\$	Fan active	AUX	Auxiliary heat active
Select	ion icons:		
Î	Room temperature	Ϋ́	Comfort mode
	Outdoor temperature	\langle	Economy mode
			Protection mode

Operating icons:	
+ _	Increment, decrement OR selection
	Selection OR move to next items
- 88.8 °°	Temperature OR parameter values, and etc.
88:88 M	Time clock (12/24 hour), parameter number OR password, etc.
0	Setpoint mode (room temperature only)
\$	Fan mode OR fan speed mode
0	Operating mode
\$	Setting mode

Touch operation

Operations	Function
Touch	to select setpoint mode; adjust temperature value using +/
Touch 🐓	to select fan mode; adjust fan speed using +/
Touch 🕲	to select operating mode; select ON/ECO/OFF using + / –.
Touch 🍄	to select the INFO screen, display room & outdoor temperatures using ◄/► if available.
	to select the desired H/C control sequence using $+/-$ if manual H/C changeover (P01 = 2) is selected.
	to display alarms if the ♣ icon is displayed; use ◄/► icon to select different alarms for viewing.
Touch 🙆 for 5 seconds	to select programming mode (KNX).
Touch 🌣 for 5 seconds	to select parameter mode (Service/Expert level).

2.5 Integration with KNX bus

The touchscreen room thermostats can be integrated as follows:

- Into Synco living using group addressing (ETS)
- Into Desigo using group addressing (ETS) or individual addressing
- Into third-party systems using group addressing (ETS)
- With Synco 700 system using LTE mode (easy engineering)

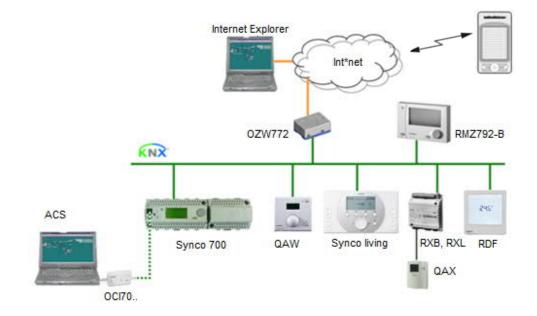

The following KNX functions are available:

- Central time program and setpoints. For example, when using the RMB795B central control unit.
- Outdoor temperature or time of day displayed on thermostat using the bus
- Remote operation and monitoring. For example, using the RMZ792-B bus operator unit.
- Remote operation and monitoring with web browser using the OZW772 web server.
- Maximum energy efficiency due to exchange of relevant energy information. For example, with Synco 700 controllers, heating demand, cooling demand.
- Alarming (such as, external fault contact, condensation, or clean filter).
- Monitoring input for temperature sensor or switch.

Engineering and commissioning can be done using...

- local DIP switches/HMI
- Synco ACS service tool
- ETS

Synco 700 The touchscreen room thermostats are tailored for interoperation with the Synco 700 system and operate together in LTE mode. This extends the field of use of Synco for individual room control in conjunction with fan coil units, heating units, chilled ceilings and radiators.

Legend	Synco 700 Synco living RDF800KN, RDF800KN/VB RDD810KN	Building automation and control system (BACS) Room automation and control system Room thermostats
	OZW772	Web server
	RMZ792-B	Bus operator unit
	QAW	Room unit
	ACS	
	OCI702	Interface for ACS
	RXB, RXL	Room controllers
	QAX	Room unit for RXB/RXL room controllers
nd third-party		ting devices can be integrated into the Siemens buildir

Desigo and third-party systems The KNX communicating devices can be integrated into the Siemens building automation and control systems (BACS) Desigo or third-party systems. For integration, you can use either S-mode (group addressing) or individual addressing.

2.6 Equipment combinations

3-position actuators	Electrical actuator, 3-position (for radiator valve)		SSA31	4893
	Electrical actuator, 3-position (for small valve 2.5 mm)		SSP31	4864
	Electrical actuator, 3-position (for small valve 5.5 mm)	00	SSB31	4891
	Electrical actuator, 3-position (for 2- and 3-port valves/VP45)	-	SSC31	4895
	Electrical actuator, 3-position (for small valve 5.5 mm)		SSD31	4861
	Electromotoric actuator, 3-position (for small valves 5.5 mm)		SQS35	4573

- **Notes:** For the maximal number of actuators operating in parallel, refer to information in the Data Sheets of the selected actuators and the following information, depending on which value is lower:
 - Parallel operation of max 6 SS.. actuators (3-position) is possible.
 - Parallel operation of max 10 On/Off actuators is possible.
 - Parallel operation of SQS35 is not possible.

3. Functions

3.1 Room temperature control

General note: Parameters	Information for setting the control parameters (e.g. P01) is described in section 3.14.
Room temperature control	 The thermostat acquires the room temperature using its built-in sensor, external room temperature sensor (QAA32), or external return air temperature sensor (QAH11.1), and maintains the setpoint by delivering actuator control commands to the heating and/or cooling equipment. The following control outputs are available: On/Off control (2-position) Modulating PI/P control with 3-position control output (only for RDF. types, 2-pipe applications)
	The switching differential or proportional band is 2 K for heating mode and 1 K for cooling mode (adjustable via P30 and P31).
	The integral action time for modulating PI control is 45 minutes (RDF), adjustable via P35.
Display	The display shows the acquired room temperature or the Comfort setpoint, which is selected using P06. The factory setting displays the current room temperature. Use P04 to change the room temperature display from °C to °F as needed.
Room temperature	The acquired room temperature (built-in or external sensor) is also available as information on the bus.
<u>\$\$</u> / \$	 With automatic changeover or continuous heating/cooling, the icons <u>//</u>^C on the top line of the screen indicate that the system currently operates in heating or cooling mode (heating or cooling output activated). With manual changeover (P01 = 2), H or C displays on the INFO page and indicates that the system currently operates in heating or cooling mode. For more information, refer to section 4.3.2.

If the outdoor temperature is available, press the \clubsuit icon on the INFO page shown below, and then use \blacktriangleleft and \blacktriangleright to select the outdoor temperature. This temperature value has only information character.

In LTE mode, the outdoor temperature can only be received in outdoor temperature zone 31.

In S-mode, the corresponding communication object needs to be bound with a KNX sensor device.

Outdoor temperature

using the bus

Time of day via bus can be displayed on the 2nd line of the LCD display on the thermostat by setting P07 to either 3 or 4. The display is either in 12- or 24-hour format.

The information can be received from a Synco controller with time master functionality or any other KNX device if the corresponding communication object is bound.

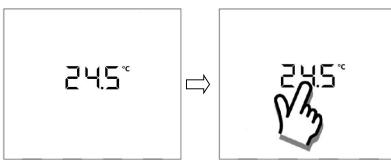

Note: When an application program is downloaded to the Synco devices using ETS, the correct group addresses must be downloaded as well to display the time of day on the thermostat. (see Synco Knowledge Base - KB771).

3.2 Operating modes

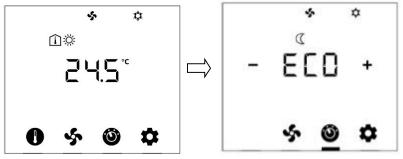

The thermostat's operating modes can be influenced in different ways (see below). Specific heating and cooling setpoints are assigned to each operating mode.

Comfort and Economy modes

In Comfort or Economy mode, the Screen Saver mode normally displays the room temperate as follows:

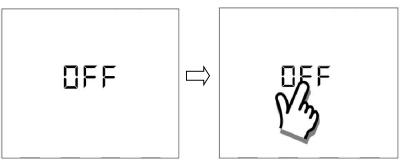

When you touch the temperature display, the Selection Screen displays (see figure on the left side below).

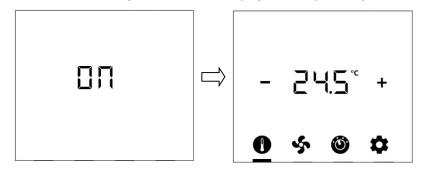

Touch the **v** icon to display the current operating mode. Use +/- to change the operating mode between Comfort (**ON**), Economy (**ECO**) or Protection (**OFF**).

Protection mode

In Protection mode, the Screen Saver mode displays OFF:

When you touch **OFF**, the thermostat changes to **ON** first and then returns to Comfort or Economy mode. Then it displays the setpoint adjustment screen.

Touch +/- to adjust the room temperature setpoint.

- Notes: In Economy mode, the I icon does not display since the setpoint is not adjustable.
 - In Protection mode, both the **①** and **§** icons do not display since both setpoint and fan speed are not adjustable.
 - On universal applications (P52 = 0), the 5 icon does not display.

KNX		The thermostat sends the effective room operating mode on the bus.
Room operating r State	node:	The following operating modes are available:
Auto Timer	\bigcirc	In Auto Timer mode, the operating mode is set using the bus only. If no time scheduler is present, Auto Timer is replaced by Comfort.
Comfort	<u>ж</u>	In Comfort mode, the thermostat maintains the Comfort setpoint. This setpoint can be defined using P08, P09 and P10. It also can be locally adjusted using +/- after touching the $\textcircled{0}$ icon or using the bus. In Comfort mode, touch the $\oiint{0}$ icon to set the fan speed to either automatic (A - AUTO) or manual fan speed (1/2/3).
KNX Presence detector	or	The thermostat switches to Comfort mode when the presence detector (local or on KNX) is active (room is occupied). See note ^{*)} .
Economy	0	 In Economy mode, the setpoints (less heating or cooling than in Comfort mode) can be defined using P11 and P12. The thermostat switches to Economy mode when you touch the icon to go to the operating mode page and use +/- to select ECO (only if P02 is set to 2) Economy is sent using the bus presence detection is not active (room unoccupied)
Protection	٥	 In Protection mode, the system is protected against frost (factory setting 8 °C, can be disabled or changed using P65) overheating (factory setting OFF, can be enabled or changed using P66) No other operating mode can be selected locally if Protection mode is commanded using the bus. OFF is displayed.
Room operating r Window state	node:	 OFF is selected using +/- after touching the ⁽¹⁾/₍₂₎ icon Protection is sent using the bus

- the window contact is active (open window)
- "Window state" is sent using the bus, e.g. from a KNX switch. See note^{*)}.
- **Note:** *) Refer to section 3.2.1 for details regarding the window contact and presence detector.

3.2.1 Influencing the operating mode

Source for change of operating mode

The operating mode can be influenced in different ways.

The source of the effective room operating mode state can be monitored using the "Cause" diagnostic data point in the ACS tool, bus operator unit RMZ792-B or web server OZW772.

Source	Description	Value of DP "Cause"
Local operation	 Operating mode is not Auto Timer 	Room operating mode selector
using operating	 No time scheduler using the bus 	(preselection)
mode 🤍 icon	 Temporary Comfort extension is active (P68 >0) 	Timer function
	Window contact	Window switch
	Presence detector	Presence detector
Bus command	 "Window state" sent using the bus 	Window switch
KNX.	 "Presence detector" sent using the bus 	Presence detector
Room operating mode	 Time scheduler available using the bus → local operating mode is set to Auto Timer Time scheduler sends Protection mode using the bus → operating mode cannot be changed locally 	Time switch

Priority of operating mode interventions

The following table shows the priorities of different interventions. A lower number means a higher priority.

Priority	Description	Remark					
1	Commissioning	In parameter setting mode (highest priority), you can command an operating mode independent of all other settings or intervention using bus and local input.					
2	Protection mode using the bus from time scheduler	Protection mode is, sent by a time scheduler It cannot be overridden by the user, or by the window contact or presence detector.					
3	Window contact	If the contact is closed (i.e. window open), the operating mode changes to Protection. This overrides the operating mode on the thermostat.					
3	"Window state" using the bus	"Window state" has the same effect as the local window contact.					
		Note: Only one input source must be used, either local input X1/X2 or KNX bus.					
4	Presence detector	If the contact is closed (room occupied), the operating mode changes to Comfort. This overrides the operating mode on the thermostat. When the contact (room unoccupied) is open, the thermostat is set back to Economy mode.					
4	Presence detector using bus	"Presence detector" has the same effect as the local presence detector.					
4	Operating mode	Touch the 🕑 icon to select the operating mode using +/–.					
4	Operating mode using the bus	The operating mode can be changed using the bus.					
4	Temporarily extended Comfort mode using operating mode icon	 Touch the icon to set operating mode from Economy to Comfort temporarily if Economy was sent using bus Extended Comfort period > 0 (P68) The last option selected is always used, either locally or using bus. 					
4	Time scheduler using the bus	The operating mode sent using the bus can be overridden by all other interventions. Exception: Protection mode has priority 2. Note: If the time scheduler switches from Comfort to Economy mode, but the presence detector is still active (room occupied), the thermostat continues to work in Comfort mode for the period of occupancy.					

Auto Timer mode () with time scheduler using the bus	If a time scheduler is available, e.g. from the central control unit, Auto Timer mode is active. The thermostat automatically changes between Comfort and Economy mode according to the time scheduler using the bus.
	The display shows the Auto Timer mode icon \bigcirc . Touch the operating mode \textcircled{O} icon to change to another operating mode.
Note:	When you are in the Auto Timer mode, and you change the operating mode, the $^{\textcircled{0}}$ icon (manual override) displays in place of the \bigcirc icon, indicating that a schedule being overridden. Default fan speed in Auto Timer mode is automatic.
Behavior when bus sends new operating mode	Each time the time scheduler sends a new operating mode (switching event), the thermostat's operating mode is set back to Auto Timer. This ensures that the room temperature is maintained according to the time schedule.
Precomfort using the bus	If the time scheduler sends the Precomfort mode, it will be switched to Economy (factory setting) or Comfort (selectable via P88).
Behavior when bus sends Protection	If Protection mode is set by the time scheduler, no intervention is possible neither by users, window contact or presence detector. The screen displays OFF .
Note:	You can still access the INFO page.
Availability of Economy mode	Touch the operating mode \textcircled{O} icon to select the operating mode using +/–. The behavior of the operating mode icon (user profile) can be defined using P02,

P02	Without time scheduler	With time scheduler using bus	Description
1	© <i>→</i> ☆	() → () Auto Timer mode = Comfort	 Select Comfort or Protection mode when there is no time schedule from the bus. Economy mode is not available If the time schedule from the bus is Protection mode, the operating mode cannot be changed. Suited for hotel guest rooms and commercial buildings.
2	@→☆→ ($(\bigcirc \rightarrow ((\rightarrow \bigcirc))$ If Auto Timer mode = Comfort $(\bigcirc \rightarrow \bigcirc)$ If Auto Timer mode = Economy	 Select Comfort, Economy or Protection mode when there is no time schedule from the bus Economy mode is available If the time schedule from the bus is Protection mode, the operating mode cannot be changed. If the time schedule from the bus is Comfort mode, you can select Economy or Protection mode. If time schedule from bus is Economy and P68 is greater than 0, Comfort mode can be temporarily extended.

factory setting is P02 = 1 (auto-protection).

Window contact

The thermostat can be forced into Protection mode when the window is opened. The contact can be connected to a multifunctional input X1, X2. Set P38 or P40 to **3**. User operations are ineffective and **OFF** is displayed if the window contact is active.

Room operating mode: Window state	The "window contact" function is also available using the KNX signal "Window state", e.g. from a KNX switch.
Note:	Only one input source can be used, either a local input X1/X2 or the KNX bus. User operations are ineffective and OFF is displayed if the operating mode "window contact" is active, or if "Window state" is sent using the bus.
Resence detector	The operating mode can be changed to Comfort and back to Economy depending on the room occupancy (room occupied/unoccupied, using the presence detector or the keycard).
	 Behavior without time scheduler: Whenever the presence detector is activated, the thermostat's operating mode of the thermostat changes to Comfort. Whenever the presence detector is deactivated, the operating mode changes to Economy.
	Behavior with time scheduler using bus:
	 When the time switch is on Protection: Presence detector has no influence on the operating mode.
	 When the time switch is on Economy: When the presence detector is activated, the operating mode changes to Comfort. When the presence detector is deactivated, the operating mode goes to (Auto) Economy.
	 When the time switch is on Comfort: and the presence detector is activated or deactivated, Comfort mode is maintained.
	Important: When the time switch goes to Economy mode, and the presence detector is still active, Comfort mode is maintained until the presence detector becomes inactive, that is, back to (Auto) Economy mode
Note:	The contact (e.g. a card reader) can be connected to a multifunctional input X1/X2 (set P38 or P40 to 10) or the occupancy signal can be sent using the bus from a KNX presence detector: Only one input source must be used, either a local input X1/X2 or the KNX bus.
Temporary timer to extend the Comfort mode	Comfort mode can be temporarily extended (e.g. working after business hours or on weekends) when the thermostat is in Economy mode. The operating mode icon switches the operating mode back to Comfort for the period preset via P68. Touch the sicon again to stop the timer.
	 The following conditions must be fulfilled: Time scheduler using the bus is Economy mode. P68 (extend Comfort period) is greater than 0.
	During the temporary Comfort mode extension, the igodoldoldoldoldoldoldoldoldoldoldoldoldol

If P68 (extend Comfort period) = 0, extended Comfort cannot be activated. Touch the O icon to switch the thermostat to Protection.

If the window contact is active, touch the **OFF** flashes on the LCD.

3.2.2 Communication example

The following example shows a typical application of a central time scheduler in conjunction with local control of the room operating mode.

The room operating mode in the room of a building is determined by the time scheduler. Window contact and presence detector are fitted in this room.

The following condition exists:

- The rooms are used and controlled by the time scheduler as follows:
 - Night setback from 17:00 to 08:00 (Economy)
 - Protection from 20:00 to 06:00
- **Example:** Application with "Window contact", "Presence detector" and time scheduler from the central control unit.

In room operating mode, Comfort is possible between 6:00 and 20:00, based on the time scheduler or occupancy period. Outside this timeframe, Protection mode is maintained.

- 1. At 6:00 the central control unit sets the operating mode to Economy. (1)
- 2. In the morning, as soon as the presence is detected (8:00 12:00), the operating mode switches to Comfort. (2)
- 3. When the user briefly opens the window, the operating mode switches to Protection. (3)
- 4. In the afternoon the time scheduler sets the Comfort mode from 13:00 to 17:00. (4)
- 5. After 17:00 the room is still occupied and the operating mode remains in Comfort (occupancy with presence detector). (5)
- 6. Later, people open the window and leave the room for a short time. The operating mode switches to Protection as long as the window is open. (6)
- 7. As soon as the room is unoccupied the thermostat switches to Economy. (7)
- 8. At 20:00 the room is set to Protection according to the time scheduler. (8)
- 9. After this time, the occupancy detected by presence detector has no effect, as the central time switch sets the thermostat to Protection. (9)

3.3 Room temperature setpoints

3.3.1 Description

Setpoint mode

Touch the **O** icon when it is available on the display and press +/- to adjust the desired room temperature setpoint.

Comfort mode The factory setting for the Comfort basic setpoint is **21** °**C**. It can be changed in the thermostat's EEPROM using P08 or the bus with the communication object "Comfort basic setpoint". The last option selected is always used.

The Comfort setpoint can be adjusted using +/–, or the bus from a remote device such as a touchpanel, or operating unit. The last option selected is always used.

Temporary setpoint If the "Temporary setpoint" function is enabled using P69, the Comfort setpoint is set back to the Comfort basic setpoint stored in P08 when the operating mode changes.

Setpoint limitation For comfort or energy saving purposes, the setpoint setting range can be limited to a minimum (P09) and maximum (P10).

- P09 < P10 (Comfort concept)
- If the minimum limit P09 is set lower than the maximum limit P10, both heating and cooling are adjustable between these two limits.
- The customer adjusts the desired setpoint and the thermostat controls the room temperature accordingly.
- For 4-pipe applications, the selected comfort setpoint is in the middle of the dead zone (P33). The unit stops energizing the heating/cooling outputs as soon as the room temperature reaches the dead zone.

Example:		///		///	Cooling setpoint adjustable: 1825 °C
	5°C	18°C	25°C	40°C	Heating setpoint adjustable: 1825 °C
		P09	P10		

P09 ≥ P10 (energy saving concept)	 If the minimum limit P09 is set higher than the limit P10, then the setting range of the cooling setpoint is from P0940 °C in place of 540 °C the setting range of the heating setpoint is from 5P10 °C in place of 540 °C. This allows the user to limit the maximum heating setpoint and the minimum cooling setpoint. This concept helps save energy costs.
	 For 4-pipe applications: The thermostat runs with the setpoint of the active sequence: In heating mode, the heating setpoint is active and adjustable using +/-;

In cooling mode, the cooling setpoint is active and adjustable using +/-.
 Switching from the heating setpoint to the cooling setpoint and vice-versa occurs when the room temperature reaches the adjusted limitation (P09 or

P10) of the **inactive** sequence. For example, the thermostat is in the heating sequence and runs with the heating setpoint. When the room temperature reaches P09, the thermostat switches to cooling mode and runs with the cooling setpoint, as long as the room temperature does not drop below P10.

Example	5°C	21°C 25°C	40°C	Cooling setpoint adjustable: 2540 °C Heating setpoint adjustable: 521 °C
		P10 P09		

Economy mode(()Use P11 and P12 to adjust the Economy mode setpoints.
The heating setpoint is factory-set to 15 °C, and the cooling setpoint to 30 °C.

Protection modeImage: Optimized base of the set of t

Caution A If a setpoint (Economy or Protection) is set to OFF, the thermostat does not control the room temperature in the corresponding mode (heating or cooling). This means that there is no protective heating or cooling function and there exists a risk of frost in heating mode or of overtemperature in cooling mode!

The Economy setpoints are accessible at the Service level (P11 or P12) or via tools (ACS or ETS). The Protection setpoints are accessible at the Expert level (P65 or P66).

3.3.2 Setting and adjusting setpoints

Room temperature setpoints can be

- set during commissioning
- adjusted during operation

setpoint

setpoint

Comfort basic setpoint

Comfort setpoint

Economy heating

Economy cooling

The source can be

- the local HMI
- a tool
- a central control unit

The thermostat stores the setpoints...

• in EEPROM in the form of parameters

• in the runtime memory

The table below shows the interrelations:

	Setpoint setting		→	Stored in thermostat's EEPROM
Commissioning – HMI – Tool download	Input LTE mode	Input S-mode		
Comfort basic setpoint Dead zone Comfort ¹⁾	Setpoints heating Setpoints cooling	Comfort basic setpoint		P08 Comfort basic setpoint P33 Dead zone Comfort ¹⁾
Setpoint Economy heating Setpoint Economy cooling	Setpoints heating Setpoints cooling	Setpoints heating Setpoints cooling		P11 Economy heating P12 Economy cooling
Setpoint Protection heating Setpoint Protection cooling				P65 Protection heating P66 Protection cooling

Current runtime setpoints in thermostat	•	Setpoint adjustment	-	New current runtime setpoints in thermostat
	Input LTE mode ²⁾	Input S-mode ³⁾	Local ope- ration	
Comfort setpoint	Setpoint shift H Setpoint shift C	Comfort setpoint	+/	Comfort setpoint
Economy heating Economy cooling	Setpoint shift H Setpoint shift C			Economy heating Economy cooling
Protection heating Protection cooling				Protection heating Protection cooling

Effective room operating mode

Current setpoint (used by the thermostat for room temperature control)

- ¹⁾ Only required for heating and cooling applications (see section 3.6.8).
- ²⁾ LTE mode: **shift is added** to the local shift.
- ³⁾ S-mode: the last option selected is always used, either S-mode input or local operation.

The current setpoint (used by the thermostat for room temperature control) is available on the bus for use by the central control unit.

- The supported communication objects are different in LTE mode and S-mode.
- Making changes using the local HMI or tool have the same priority.

Notes on setpoint adjustment (LTE mode with Synco only)

- Setting the Comfort basic setpoint resets the runtime Comfort setpoint to the basic setpoint.
- Central setpoint shift is used for summer or winter compensation.
- Setpoint shift does not affect the parameter setpoints in P08, P11, P12 and P33.
- Local shift and central shift are added together.
- Only applies to Comfort and Economy setpoints. Protection setpoints are not shifted centrally.
- The current setpoints for heating and cooling are limited by the Protection setpoint. If the Protection setpoint is OFF, min. 5 °C and max. 40 °C are used.
- The setpoints for cooling and heating of the same operating mode have a minimum distance of 0.5 K between them.
- The result of local and central shift, together with the room operating mode, is used by the thermostat for room temperature control (current setpoint).
- The room thermostat always adopts the received setpoints from the controller RMB795B. Thus the Comfort setpoints locally adjusted on the thermostats are overwritten by the Comfort setpoints of the room group (e.g. every 15 minutes).

On the RMB795B central control unit (software version 2.0 or higher), you can define the conditions required for the unit to forward the setpoints:

- Always (every 15 minutes)
- Not in Comfort mode
- Only when changed

See "Setpoint priority" and "Setpoint master" functions on the RMB795B.

3.4 Applications overview

The thermostats support the following applications, which can be configured using the DIP switches inside the front panel of the unit or a commissioning tool.

- 1. Set applications via DIP switches.
- 2. After the thermostat is first powered up, the display depends on the selected application.

→ Go to the setting mode and configure the basic control parameters

Display	Applications
APP	2-pipe
2P	
APP	2-pipe with
2PEH	electric heater
APP	1 nine
4P	4-pipe
APP	2-pipe with 3-
2P3P	position output

Note: For RDD810KN..., APP H displays after powering up.

Local configuration RDF800KN.., RDF800KN/VB only

Setpoint priority,

Setpoint Master RMB

All DIP switches must be set to OFF (remote configuration, factory setting) in order to select an application using the commissioning tool.

DIP switches

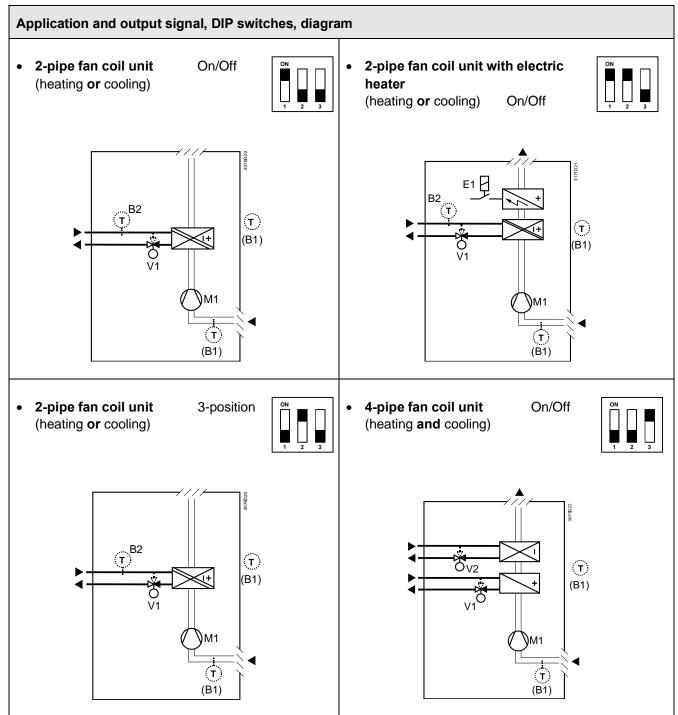

Remote configuration, using one of the following tools (factory set)

• Synco ACS

• ETS4

For more information, see the following sections:

- Section 3.4.1 "Applications for fan coil systems (RDF800KN.., RDF800KN/VB only)";
- Section 3.4.2 "Applications for universal systems (RDF800KN.., RDF800KN/VB only)";
- Section 3.4.3 "Applications for heat pump systems (RDF800KN.., RDF800KN/VB only)";
- Section 3.6.6 "Chilled/heated ceiling and radiator applications (RDF800KN.., RDF800KN/VB only)".

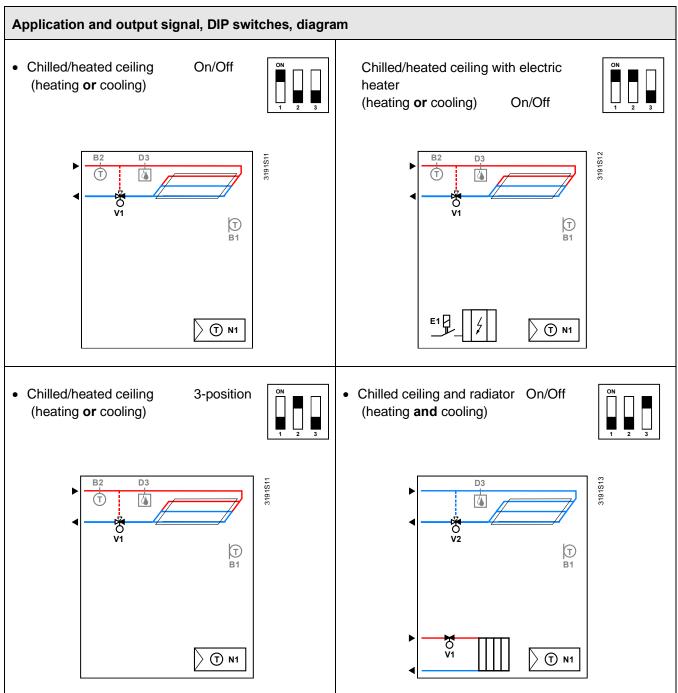

3.4.1 Applications for fan coil systems (RDF800KN.., RDF800KN/VB only)

- V1 Heating or heating/cooling valve actuator
- V2 Cooling valve actuator
- E1 Electric heater

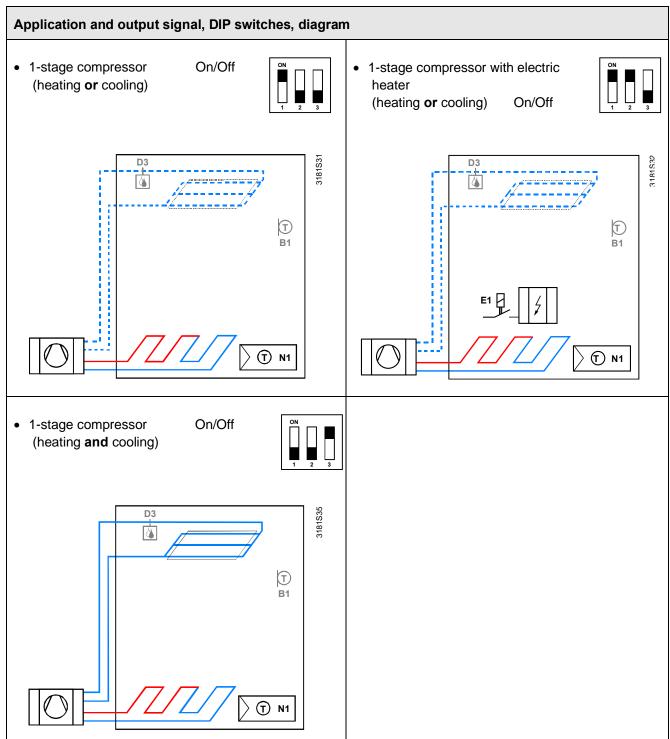

- B1 Return air temperature sensor or external room temperature sensor (optional)
- B2 Changeover sensor (optional)
- M1 1- or 3- speed fan

3.4.2 Applications for universal systems (RDF800KN.., RDF800KN/VB only)

- V1 Heating or heating/cooling valve actuator
- V2 Cooling valve actuator
- E1 Electric heater

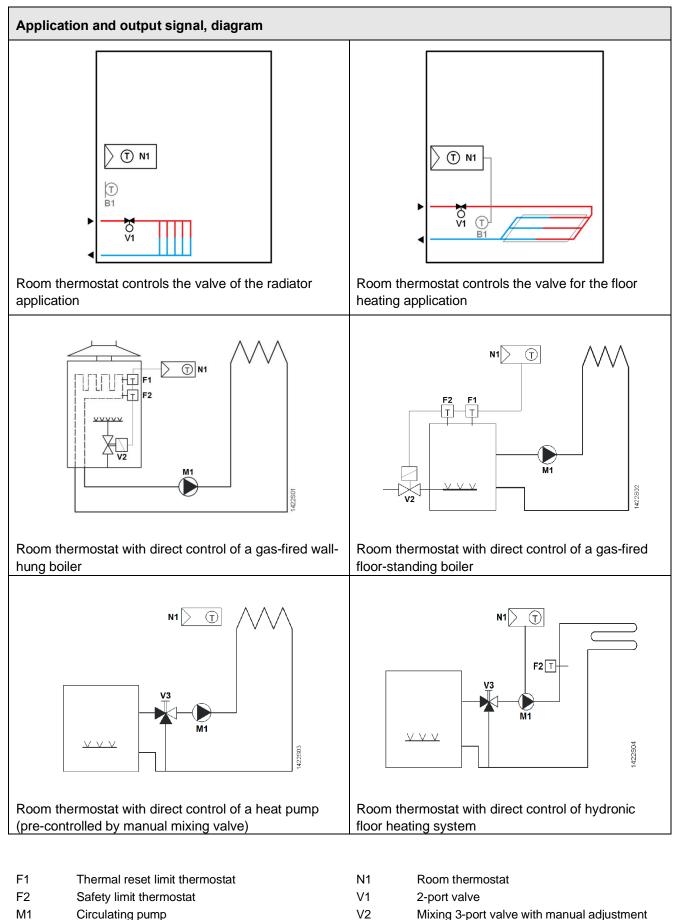

- B1 Return air temperature sensor or external room temperature sensor (optional)
- B2 Changeover sensor (optional)
- D3 Dew point sensor

3.4.3 Applications for heat pump systems (RDF800KN.., RDF800KN/VB only)

- N1 Thermostat Terminal Y1: Heating or heating/cooling Terminal Y2: for cooling (H&C)
- E1 Electric heater

- B1 Return air temperature sensor or external room temperature sensor (optional)
- D3 Dew point sensor

V3 Magnetic valve

3.5 Additional functions

Heating/cooling changeover using bus

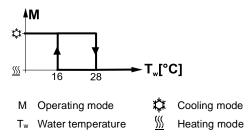

Automatic heating/cooling changeover using changeover sensor The heating/cooling changeover information can only be received using the bus, if the control sequence is set to automatic heating/cooling changeover (P01 = 3), and no local input X1/X2 is assigned with this function.

When the required information is missing (e.g. due to problems with data communication, or a power failure), the thermostat operates in the last valid room operating mode (heating or cooling).

If a cable temperature sensor (QAH11.1 + ARG86.3) is connected to X1/X2, and P38 or P40 = 2, the water temperature acquired by the changeover sensor changes over from heating to cooling mode, or vice versa. When the water temperature is above 28 °C (P37), the thermostat changes over to heating mode, and to cooling mode when below 16 °C (P36).

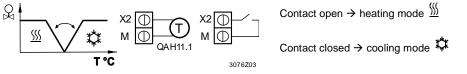

If the water temperature is between the two changeover points immediately after power-up, the thermostat starts in the previously active mode.

The water temperature is acquired at 30-second intervals and the operating state is updated accordingly.

Changeover switch

The QAH11.1 cable temperature sensor for automatic heating/cooling changeover can be replaced by an external switch for manual, remote changeover:

The sensor or switch can be connected to input terminal X2 or X1, depending on the commissioning of the inputs (P38/P40). See also section 3.9.

Notes: By using an external switch for changeover, the operating action (P39 or P41) cannot be modified.

- Contact open \rightarrow heating mode $\underline{\mathbb{M}}$
- Contact closed → cooling mode [‡]

Manual heating/cooling changeover	If manual heating/cooling changeover is set (P01 = 2), heating/cooling mode cannot be changed using the bus, changeover sensor or switch; it will remain in the manually selected mode.
External/return air temperature sensor	The thermostat acquires the room temperature through its built-in sensor, external room temperature sensor (QAA32), or external return air temperature sensor (QAH11.1) connected to multifunctional input X1 or X2. Input X1 or X2 must be configured accordingly. See section 3.9.
Purge function	The changeover sensor ensures changeover from heating to cooling and vice versa, based on the acquired water temperature. We recommend you activate the "Purge" function (P50) with 2-port valves. This function ensures correct acquisition of the medium temperature even if the 2-port valve is closed for an extended period of time. The valve is then opened for 1 to 5 minutes (adjustable) at 2-hour intervals during off hours.
Caution 🖄	The "Purge" function (P50) must be disabled if the thermostat is used in compressor-based applications.
Avoid damage from moisture	In very warm and humid climates, the fan can be run periodically or continuously at a low fan speed (e.g. in empty apartments or shops) in Economy mode by setting P61, in order to avoid damage from moisture due to lack of air circulation. See also section 3.8.
Minimum output ON-time/OFF-time	Limit the On/Off switching cycle to protect the HVAC equipment (e.g. a compressor) and to reduce wear and tear. The minimum output ON-time and OFF-time for 2-position control output can be adjusted from 1 to 20 minutes using P48 and P49.
	The factory setting is 1 minute.
	Readjusting the setpoint or heating/cooling mode changeover immediately results in calculation of the output state; the outputs may not hold the minimum 1-minute On/Off time.
	If P48 or P49 is set to above 1 minute, the minimum On/Off time for the control output is maintained as set, even if the setpoint or changeover mode is readjusted.
Floor heating/ Floor cooling	All heating sequences can also be used for floor heating. You can use fan coil unit heating/cooling sequences for floor heating or cooling by disabling the fan via P52.
Floor temperature limitation function	The floor temperature should be limited for two reasons: Comfort and protection of the floor.
	The floor temperature sensor, connected to multifunctional input X1 or X2, acquires the floor temperature. If it exceeds the parameterized limit (P51), the heating valve is fully closed until the floor temperature drops to a level 2 K below the parameterized limit.
	Factory setting of this function is "OFF" (disabled).
	Input X1 or X2 must be configured accordingly (P38 or P40 = 1). See section 3.9.
Recommended values for P51:	Living rooms: Up to 26 °C for long-time presence, up to 28 °C for short-time presence.
	Bathrooms: Up to 28 °C for long-time presence, up to 30 °C for short-time presence.

The table below shows the relation between parameter, temperature source and temperature display:

P51	External temp. sensor available	Source for display of room temperature	Output control according to	Floor temp. limit function
OFF	No	Built-in sensor	Built-in sensor	Not active
OFF	Yes	External sensor	External temp. sensor	Not active
1050 °C	No	Built-in sensor	Built-in sensor	Not active
1050 °C	Yes	Built-in sensor	Built-in sensor + limit by external sensor	Active

The "Floor temperature limitation" function influences the outputs listed in the table below:

			"Floor temp. limit" function has impact on			
Application	Output Y11	Output Y21	Heating (P01 = 0/2/3)	Cooling (P01 = 1/2/3)	Heat. and cool. (P01 = 4)	Remark
2-pipe	H/C valve		Y1	N/A		
2-pipe and electric heater	H/C valve	El heater	Y1, Y2	Y2*)		
4-pipe	Heating valve	Cooling valve	Y1	N/A	Y1	

^{*)} If P13 = ON \rightarrow electric heater in cooling mode

Note: Either floor temperature sensor or external room temperature sensor can be used.

Dew point monitoring Dew point monitoring is essential to prevent condensation on the chilled ceiling (cooling with fan disabled, P52). It helps avoid associated damage to the building. A dew point sensor with a potential-free contact is connected to multifunctional input X1 or X2. If there is condensation, the cooling valve is fully closed until no more condensation is detected, and the cooling output is disabled temporarily.

Fault state	The alarm \clubsuit icon flashes during temporary override and the fault "Condensation in room" is sent using the bus.
Fault information	The input must be configured accordingly (P38, P40). See section 3.9.
Screen Lock	The "Screen lock" function is enabled and disabled only by using P14. There are

The "Screen lock" function is enabled and disabled only by using P14. There are three options:

- Unlock
- Locked (all adjustments are locked but can be viewed)
- Setpoint (note: only setpoint adjustment is not locked)

Buzzer

The "Buzzer" function provides audio feedback when you touch the operating icons on the thermostat (see page 9). Enable or disable the "Buzzer" function via P16.

3.6 Control sequences

3.6.1 Sequences overview using P01 (RDF800KN.., RDF800KN/VB only)

The main control sequence (such as the water coil sequence of the fan coil unit) can be set via **P01**.

The following sequences can be activated in the thermostats (each without or with auxiliary heating). The available sequences depend on the application (via the DIP switch, see section 3.4).

Parameter	P01 = 0	P01 = 1	P01 = 2	P01 = 3	P01 = 4
Sequence	Se t weight with the second s		Q //3 <u>S</u> //3 T°C		
Available for basic application ¹⁾ : ♥	Heating	Cooling *) 2-pipe with electric heater	Manually select heating or cooling sequence	Automatic heating/cooling changeover using external water temperature sensor or remote switch	Heating and cooling sequence, i.e. 4-pipe
2-pipe, 2-pipe and electric heater	✓	✓	~	~	
4-pipe			√ ²)	√ ²)	✓

Notes:

¹⁾ For chilled/heated ceiling and radiator applications, see section 3.6.6; for compressor applications, see section 3.6.7.

- ²⁾ For manual and automatic changeover with 4-pipe applications, see section 3.6.5:
 - 4-pipe manual changeover (P01 = 2) means activating either cooling or heating outputs.

For the relation between setpoints and sequences, see section 3.6.8.

3.6.2 Application mode

The behavior of the thermostat can be influenced by a building automation and control system (BACS) via the bus using the "Application mode" command.

With this signal, cooling and/or heating mode can be enabled or disabled. Application mode is supported in LTE mode and S-mode.

The RDF800KN../RDF800KN/VB/RDD810KN.. room thermostats support the following commands:

No.	Application mode	sequence sequence enabled enabled		Control sequence enabled (RDD810)
0	Auto	Thermostat automatically changes between heating and cooling	Heating and/or cooling	Heating or Heating OFF ¹⁾
1	Heat	Thermostat is only allowed to heat	Heating only	
2	Morning warm-up	If "Morning warm-up" is received, the room should be heated up as fast as possible (if necessary). Thermostat only allows heating	Heating only	
3	Cool	Thermostat is only allowed to provide cooling	Cooling only Heating OFF	
4	Night purge	Not supported by fan coil applications	N/A (= Auto)	
5	Pre-cool	If "Pre-cool" is received, the room should be cooled down as fast as possible (if necessary). The thermostat will only allow cooling	Cooling only Heating OFF	
6	OFF	Thermostat is not controlling the outputs, which means all outputs go to off or 0%	Neither heating nor cooling	
8	Emergency heat	Thermostat should heat as much as possible. It only allows heating	Heating only	
9	Fan only	All control outputs are set to 0% and only the fan is set to high speed. This function is terminated by any operation on the thermostat	et to high high speed	

¹⁾ RDD810KN... thermostat turns off the heating output.

With all other commands, the thermostat behaves like in Auto mode, such as, heating or cooling according to demand.

🌮 ACS

The state (heating or cooling) of the thermostat can be monitored with the ACS tool (diagnostic value "Control sequence"). The last active mode is displayed when the thermostat is in the dead zone or when room temperature control is disabled.

Heating OR cooling

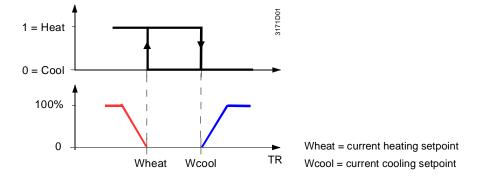

With 2-pipe applications, the control sequence state is determined by the application mode (see section 3.6.3) and by the state of the heating/cooling changeover signal (using the local sensor or the bus), or fixed according to the selected control sequence (P01 = heating (0)/cooling (1)).

Application mode (using bus)	State changeover/continuous heating or cooling	Control sequence state
$A_{\rm uto}(0)$	Heating	Heating
Auto (0)	Cooling	Cooling
Heat (1), (2), (8)	Heating	Heating
	Cooling	Heating
Cool(2) (5)	Heating	Cooling
Cool (3), (5)	Cooling	Cooling
Night purge (4),	Heating	Heating
fan only (9)	Cooling	Cooling

Heating AND cooling With 4-pipe, 2-pipe with electric heater, and 2-pipe with radiator applications, the control sequence state depends on the application mode and the heating/cooling demand.

Application mode (using the bus)	Heating/cooling demand	Control sequence state
	Heating	Heating
Auto (0)	No demand	Heating/cooling depending on
		the last active sequence
	Cooling	Cooling
	Heating	Heating
Heat (1), (2), (8)	No demand	Heating
	Cooling	Heating
	Heating	Cooling
Cool (3), (5)	No demand	Cooling
	Cooling	Cooling
Night purge (4),	No room temperature control	Heating/cooling depending on
Fan only (9)	active	the last active sequence

The following diagram shows the value of the output as a function of the room temperature for a heating and cooling system:

2-pipe fan coil unit (RDF800KN.., RDF800KN/VB only) 3.6.3

On 2-pipe applications, the thermostat controls a valve in heating/cooling mode with changeover (automatically or manually), heating only, or cooling only. Factory setting is "Cooling only" (P01 = 1).

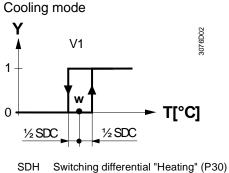

The diagrams below show the control sequence for 2-position control.

Room temperature setpoint

Control command "Valve"

Setting the sequence and the control outputs Refer to sections 3.4, 3.6.1, and 3.7.

3.6.4 2-pipe fan coil unit with electric heater (RDF800KN.., RDF800KN/VB only)

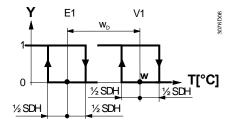

Heating or cooling with auxiliary heater	On 2-pipe applications with electric heater, the thermostat controls a valve in heating/cooling mode with changeover, heating only, or cooling only plus an auxiliary electric heater.
	Cooling only is factory-set $(P01 = 1)$ with electric heater enabled $(P13)$.
Electric heating, active in cooling mode	In cooling mode, the valve receives an OPEN command if the acquired room temperature is above the setpoint. The electric heater receives an ON command if the acquired room temperature drops below "setpoint" minus "dead zone" (= setpoint for electric heater) while the electric heater is enabled (P13 = ON).
Note:	"Setpoint for electric heater" is limited by parameter "Comfort setpoint maximum" (P10).
Electric heating in heating mode	In heating mode, the valve receives an OPEN command if the acquired tempera- ture is below the setpoint. The electric heater is used as an additional heat source when the heating energy controlled by the valve is insufficient.
	The electric heater receives an ON command, if the room temperature is below "setpoint" minus "setpoint differential" (= setpoint for electric heater).
Electric heating and manual changeover	The electric heater is active in heating mode only and the control output for the valve is permanently disabled when manual changeover is selected (P01 = 2).
Digital input "Enable electric heater"	Remote enabling/disabling of the electric heater is possible using input X1 or X2 for tariff regulations, energy savings and so on.
	Input X1 or X2 must be configured accordingly (P38/P40). See section 3.9.
KNX'	The electric heater can also be enabled/disabled using the bus.
Enable electric heater	
Note:	If "Enable electric heater" input uses the bus, the function must not be assigned to a local input X1 or X2.
Caution 🥂	An electric heater must always be protected by a safety limit thermostat!

On/Off control Control sequence ON/OFF output

Notes:

• For the fan sequence see section 3.8.

Setting the sequence and the control outputs

Refer to sections 3.4, 3.6.1, and 3.7.

3.6.6 Chilled/heated ceiling and radiator applications (RDF800KN.., RDF800KN/VB only)

For chilled/heated ceilings and radiators, proceed as follows:

The diagrams only show the PI thermostat's proportional action.

- 1. Set the corresponding basic application;
- 2. Disable the fan (P52).

The following applications are available:

Application for chilled/heated ceiling, radiator	Set basic application	See section	Sequences
Chilled/heated ceiling with changeover	2-pipe	3.6.3	H (\) C (<i>I</i>)
Chilled/heated ceiling and electric heater (cooling only: disable electric heater using P13)	2-pipe and electric heater	3.6.4	EIH+H(& \) EIH+C(& /) C (/)
Chilled ceiling and radiator	4-pipe	3.6.5	H+C (\/)

3.6.7 Compressor applications (RDF800KN.., RDF800KN/VB only)

For compressor applications, proceed as follows:

- 1. Set the corresponding basic application
- 2. Disable the fan (P52) or set the fan speed (P53)

The following applications are available:

Application for compressor	Set basic application	See section	Sequences
1-stage compressor for heating or cooling	2-pipe	3.6.3	H (\) C (<i>I</i>)
1-stage compressor and electric heater (for cooling only: disable electric heater using P13)	2-pipe and electric heater	3.6.4	EIH+H(ᡧ \) EIH+C(ᡧ /) C (/)
1-stage compressor for heating and cooling	4-pipe	3.6.5	H+C (\/)

Notes:

Minimum On/Off time: P48/P49

• Fan operation:P52 (0 = disabled, 1 = enabled)

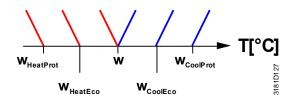

• Fan speed: P53 (1 = 1-speed, 2 = 3-speed)

3.6.8 Setpoints and sequences (RDF800KN.., RDF800KN/VB only)

2-pipe applications On changeover applications, the Comfort setpoints for heating and cooling sequence are the same (w).

On 2-pipe applications with electric heater, the Comfort setpoint is either at the first heating sequence (in heating mode) or at the cooling sequence (in cooling mode).

The setpoints for Economy and Protection mode are below the Comfort setpoints (heating) and above the Comfort setpoints (cooling), which can be set using P11, P12 (Economy mode) and P65, P66 (Protection mode).

	Comfo	ort mode	Economy/Pr	otection mode
Application	Heating	Cooling	Heating	Cooling
2-pipe	Y W T	Y W T	Y WHeatEco/Prot	Y WCoolEco/Prot
2-pipe and electric heater	Y E1 ²⁾ W T	Y E11) V W T	Y E1 ²⁾ WHeatEco/Prot	Y E1 ¹⁾ WHeatEco/Prot WCoolEco/ProtT

²⁾ In case of manual changeover (P01 = 2), the first heating sequence is disabled to prevent heating (electric heater) and cooling (coil) at the same time
 W = setpoint in Comfort mode
 W_{HeatEco/Prot} = setpoint heating in Economy or Protection mode
 W_{CoolEco/Prot} = setpoint cooling in Economy or Protection mode
 YR = radiator sequence
 E1 = electric heater sequence
 4-pipe applications
 On 4-pipe applications, the Comfort setpoint (w) is in the middle of the dead zone, between the heating and the cooling sequence.

The dead zone can be adjusted via P33.

If manual changeover is selected, then either the cooling sequence or the heating sequence is released. In this case, the Comfort setpoint is at the selected heating or cooling sequence.

		Economy/Protection mode		
Application	Heating and cooling	Heating only ¹⁾	Cooling only ¹⁾	Heating and/or cooling
4-pipe	Y W T	Y W T	Y W T	WHeatEco/Prot WCoolEco/ProtT

¹⁾ Manual changeover, P01 = 2

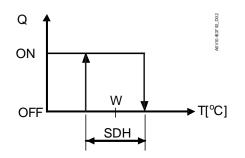

W = setpoint in Comfort mode

 $W_{HeatEco/Prot}$ = heating setpoint for Economy or Protection mode

W_{CoolEco/Prot} = cooling setpoint for Economy or Protection mode

3.6.9 Heating (RDD810KN... only)

The RDD810KN... room thermostat controls the 2-position outputs in heating mode:

- T[°C] Room temperature
- w Room temperature setpoint
- SDH Switching differential "Heating" (P30)
- Q Output signal for heating

3.7 Control outputs

3.7.1 Overview

	Different control outpu commissioning (see be	-	able. They must be de	fined during	
Control output Product no.	2-position	2-position PWM	3-position	DC 010 V	
RDF800KN, RDF800KN/VB	Y1, Y2 (2 x SPST)		Y1, Y2 ^{*)} (1 x ▲/▼)		
RDD810KN	Q11, Q12, Q14 (1 x SPDT)				
On/Off control signal	^{•)} Only applies to 2-pipe app The valve or compress or Y2 when…		PEN/ON command fro	om control output Y1	
 The acquired room temperature is below the setpoint (heating mode) or above the setpoint (cooling mode). The control outputs have been inactive for more than the "Minimum output OFF-time" (factory setting 1 minute, adjustable via P48). 					
	The OFF command is received when				
	1. The acquired room temperature is above the setpoint (heating mode) or below the setpoint (cooling mode).				

2. The valve has been active for more than the "Minimum output on-time" (factory setting 1 minute, adjustable via P49).

Electric heater control
signalThe electric heater receives an ON command using the auxiliary heating control
output (Y., see Mounting Instructions) when...(2-position)• The acquired room temperature is below the "setpoint for electric heater".

• The electric heater has been off for at least 1 minute.

The OFF command for the electric heater is output when...

- The acquired room temperature is above the setpoint (electric heater).
- The electric heater has been on for at least 1 minute.

Caution AA safety limit thermostat (to prevent overtemperatures) must be provided externally.Adaptive temperature
compensation for
electric heaterWhen an electric heater is connected directly to On/Off output Y2, the current
causes the relay contact to heat up. This falsifies the reading of the built-in
temperature sensor. The thermostat compensates the temperature if the rated
power of the electric heater): Factory setting 0 kW, setting range: 0.0...1.2 kW.

3-positionOutput Y1 provides the OPEN command, and Y2 delivers the CLOSE command to
the 3-position actuator.
The factory setting for the actuator's running time is 150 seconds. It can be
adjusted via P44.
The parameter is only visible if 3-position is selected via the DIP switches.

Synchronization

- When the thermostat is powered up, a closing command for the actuator running time + 150% is delivered to ensure that the actuator fully closes and synchronizes to the control algorithm.
- When the thermostat calculates either the fully closed or fully open position, the actuator's running time is extended + 150% to ensure the right actuator position is synchronized to the control algorithm.
- After the actuator reaches the position calculated by the thermostat, a waiting time of 30 seconds is applied to stabilize the outputs.

Outputs Q14 and Q12 deliver the Normal Open (NO) and Normal Closed (NC) commands to the 2-position valve.

Both outputs are potential-free, depending on the Q11 input. Q11 can accept AC 24...230 V input voltage.

Output Q14 (NO) will be closed or output Q12 (NC) will be opened when the acquired room temperature is below its setpoint.

Q11 and Q14, or Q11 and Q12 can be used as a relay contact for switching the boiler on and off.

3.7.2 Control outputs configuration (using the DIP switches or the tool) (RDF800KN.., RDF800KN/VB only)

In 2-pipe applications (2- or 3-position), the control outputs are set using the DIP switches (see section 3.4).

The DIP switches have no impact if the application is set up via tools. In this case, the control outputs need to be set with the ACS tool.

Heating output control signal (2-position) RDD800KN/NF only

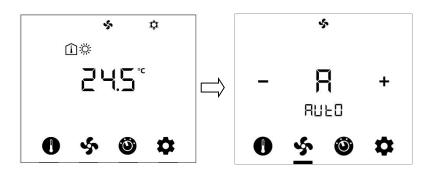

3.8 Fan control (RDF800KN.., RDF800KN/VB only)

The fan operates in automatic mode or at the selected speed in manual mode. In automatic mode, the fan speed depends on the setpoint and the current room temperature. When the room temperature reaches its setpoint, the control valve closes and the fan switches off or stays at fan speed 1 according to the setting of P15 (fan stage in dead zone Comfort) and P60 (fan kick).

Factory setting for "Fan in the dead zone": Fan speed OFF (P15 = 0, P60 = OFF)

Touch the 5° icon when available and use +/- to adjust the fan speed.

Both the \clubsuit and D icons display when manual fan speed is selected.

Display	Fan speed selection
- R + RUED	Auto
- (+	Low
- 2 +	Medium
- 3 +	High

Fan command value Enable fan command value

Fan operation

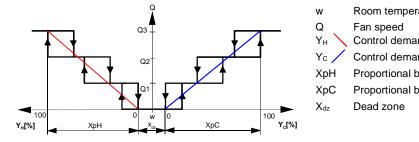

Fan stage 1/2/3 Fan output Fan speed and mode can be monitored using the bus.

Fan speed and mode can be changed using the bus. For this purpose, the fan command value must be enabled.

Siemens Smart Infrastructure

3-speed fan control with modulating heating/cooling control

The individual switching points for **ON** of each fan speed can be adjusted via P55...P57. The fan speed switch off point is 20% below the switch-on point. The diagrams below show fan speed control with modulating PI control.

Room temperature setpoint Control demand "Heating" Control demand "Cooling" Proportional band "Heating" Proportional band "Cooling"

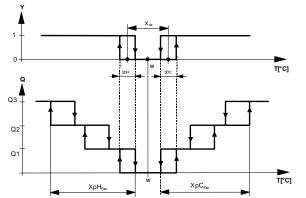

Note:

The diagram only shows the PI thermostat's proportional part.

3-speed fan control with On/Off heating/cooling control

Applications with 2-position control:

- The switching point for low fan speed (Q1) is synchronized to the heating/cooling output. P57 is not relevant.
- The maximum switching range of the fan (XpHFan/XpCFan) is defined by the switching differential (SDH/SDC) using a look-up table.

- T[°C] Room temperature
- w Room temperature setpoint
- Q Fan speed
- Y Control command "Valve"
- SDH Switching differential "Heating" P30 SDC Switching differential "Cooling" P31
- X_{dz} Dead zone
- XpH_{Fan} Switching range for fan "Heating"

XpCFan Switching range for fan "Cooling"

Look-up table with	SDH/SDC	[K]	0.5	1.0	1.5	2.0	2.5	3.0	3.5	4.0	>4.5

1-speed/3-speed fan	The thermosta	t can c	ontrol a	a 1-spe	ed or 3	-speed	fan (se	elected	l via P5	3).	

A 1-speed fan is connected to terminal Q1, a 3-speed fan is connected to terminals Q1, Q2 and Q3.

Fan operation as per Fan operation can be limited to be active with cooling only or heating only, or even heating/cooling mode, be totally disabled via P52 (fan operation).

or disabled

the operating icons (see page 9) on the last line disappear from the touchscreen. This function allows you to use the thermostat on universal applications such as chilled/heated ceilings, or radiators (see section 3.6.6).

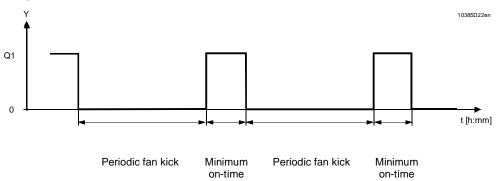

When fan operation is disabled (P52 = 0), both the fan icon 5° on the top line and

Fan minimum In automatic mode, a dwelling time of 2 minutes (factory setting) is active. The fan on-time maintains each speed for at least 2 minutes before changing to the next speed. This minimum on-time can be adjusted from 1...6 minutes via P59.

Fan operation in dead zone (fan kick)

In automatic fan mode and with the room temperature in the dead zone, the control valve is normally closed and the fan disabled. With the "Fan kick" function, the fan can be released from time to time at low speed for minimum on-time (see above) even if the valve is closed.

This function can be used to avoid damage from moisture due to a lack of air circulation, or to allow a return air temperature sensor to acquire the correct room temperature.

The periodic fan kick time can be selected individually for Comfort mode via P60, and for Economy mode via P61.

Notes:

- A fan kick value of **0** means the fan runs continuously in the dead zone.
 - A fan kick value **OFF** means the fan does not run in the dead zone.

Fan operation in dead zone P15, Comfort mode

Using P15 at the Service level, the fan speed in the dead zone (in Comfort mode) can be set according to customer preference. The following options are available:

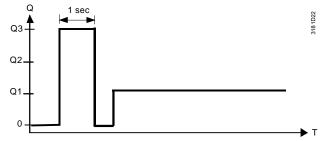

- Fan does not run in the dead zone (P15=0).
- Fan runs at low speed in heating and cooling mode (P15=1).
- Fan runs at low speed in cooling mode only (P15=2).

The functions "Fan in dead zone" (P15) and "Fan kick" (P60) are combined as follows:

- P60 = 0 Fan runs continuously in the dead zone, P15 has no influence.
- P60 = OFF Fan operation in dead zone according to P15.

Fan start kick

The fan first starts at speed 3 for 1 second to ensure safe fan motor start by overcoming inertia and friction (selected using P58).

Fan overrun for electric heater

When the electric heater is switched off, the fan overruns for 60 seconds (P54) to either avoid overtemperature of the electric heater or to prevent the thermal cutout from responding.

CAUTION

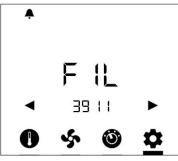

In case of fan failure, the thermostat cannot protect the electric heater against overtemperature. For this reason, the electric heater must be equipped with a separate safety device (thermal cutout).

Clean filter reminder

Fault information

The "Clean filter reminder" function counts the fan operating hours and displays message ' \clubsuit FIL" to remind the user to clean the fan filter as soon as the threshold is reached. This does not impact the thermostat's operation, which continues to run normally. The function is set using P62 (default = OFF (0)).

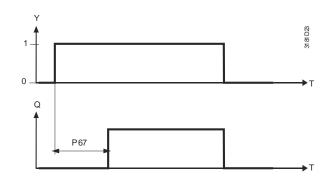

The "Clean filter reminder" function can be removed using +/- when viewing alarms on the INFO page.

Fan in Auto TimerIn Auto Timer mode (), the default fan mode is automatic. It can be changed to
Manual by touching the sicon. The fan returns to the automatic default mode
after each switchover from Comfort to Economy mode, and vice versa.

Fan start delay

To let the heating/cooling coil reach its temperature, the fan start can be delayed by a time period set via P67.

3.9 Multifunctional input, digital input

The thermostat has two multifunctional inputs X1 and X2. An NTC type sensor, such as the QAH11.1 (AI, analog input) or a switch (DI, digital input) can be connected to the input terminals. The functionality of the inputs can be configured using P38 or P39 for X1 and P40 or P41 for X2.

The current temperature or the state of inputs X1 or X2 is available on bus for monitoring purposes.

The parameters can be set to the following values:

	No.	Function of input	Description	Type X1/X2	RDF	RDD
	0	Not used	No function.		~	~
	1	External/return air temperature	Input for external room temperature sensor or return air temperature sensor to acquire the current room temperature, or for floor heating temperature sensor to limit the heating output.	AI	~	×
			Note: The room temperature is acquired by the built-in sensor if the floor temperature limitation function is enabled via P51.			
KNX	2	Heating/cooling changeover	Sensor input for "Automatic heating/cooling changeover" function.	AI/DI	✓	
Heating/ Cooling changeover			A switch, rather than a sensor, can also be connected.			
J			Note: A closed switch always means cooling; this cannot be changed. See section 3.5.			
			Heating/cooling changeover is also possible via the bus. In this case, the function must not be assigned to local input X1, or X2. See section 3.5.			
			 Diagnostic value displays one of the following: 00 for closed contact 100 for open contact, if a switch is connected. 			
Window state	3	Window contact	Window contact input to switch the operating mode to Protection. If the window contact is open, user operations have no impact and OFF displays.	DI	~	~
			Window contact is also possible using the bus. In this case, the function must not be assigned to local input X1 or X2. See section 3.2.1.			
	4	Dew point monitor	Digital input for a dew point sensor to detect condensation. Cooling is stopped if condensation occurs.	DI	✓	

	No.	Function of input	Description	Type X1/X2	RDF	RDD
Enable elec-	5	Enable electric heater	Digital input to enable/disable the electric heater using remote control.	DI	~	
tric heater	_		Enabling the electric heater is also possible using the bus. In this case, the function must not be assigned to local input X1 or X2. See section 3.2.1.			
KNX	6	Fault	Digital input to signal an external fault (e.g. dirty air filter).	DI	~	~
Fault information			If the input is active, ALx displays and a fault is sent on the bus. See also section $3.11.8$. (Alarm x, where x = 1 for X1, x = 2 for X2).			
			Note: Fault displays have no impact on the thermostat's operation. They merely represent a visual signal.			
X1, X2 (Digital)	7	Monitor input (digital)	Digital input to monitor the state of an external switch via the bus, e.g. to send a local alarm using KNX to the central control unit.	DI	V	•
X1, X2 (Temp.)	8	Monitor input (temperature)	Sensor input to monitor the state of an external sensor (e.g. QAH11.1) via the bus, e.g. to send a local temperature (049°C) via KNX to the central control unit.	AI	V	*
Presence detector	10	Presence detector	Presence detector input to switch the operating mode to Comfort in case of occupancy and back to Economy when the room is unoccupied.	DI	~	~
			Presence detectionis also possible via bus. In this case, the function must not be assigned to local input X1 or X2. See section 3.2.1.			

- Operating action can be changed between normally open (NO) and normally closed (NC) using P39 or P41.
- Inputs X1 and X2 must be configured with a different function (1...5, 10).
 Exception: 1 or 2 inputs can be configured as fault (6) or monitor input (7, 8).
- X1 is factory-set to "Window contact" (3), X2 to "External sensor" (1).

For more detailed information, refer to section 3.4.

3.10 Handling faults

Room temperature out of range	When the room temperature is out of the measuring range (that is, above 49 °C or below 0 °C), the limiting temperature flashes.
	In addition, the heating output is activated if the current setpoint is not set to "OFF", the thermostat is in heating mode and the temperature is below 0 °C.
	For all other cases, no output is activated.
	The thermostat resumes Comfort mode after the temperature returns to the measuring range.
Fault "Er1" on display	If the built-in sensor fails and no external sensor is connected, the thermostat displays error message Er1 . This means that the thermostat must be replaced if the room temperature is acquired with the built-in sensor.
KNX	For error status messages on the bus, see section 3.11.8.
Power failure	In the event of a power failure, all working conditions (operating mode, setpoint, fan speed, and all control parameter settings) are stored without time limitation.
	When power returns, the thermostat reloads this data and continues to work in the same conditions as before.

3.11 KNX communications

The RDF800KN./RDF800KN/VB/RDD810KN.. KNX room thermostats support communications as per KNX specification.

- S-mode Standard mode; engineering using group addresses.
- LTE mode Logical Tag Extended mode, for easy engineering, used in conjunction with Synco.

3.11.1 S-mode

This mode corresponds to KNX communications.

Connections are established via ETS by assigning communication objects to group addresses.

3.11.2 LTE mode

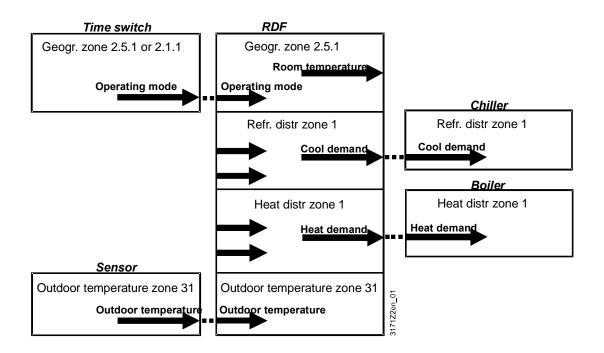

LTE mode was specifically designed to simplify engineering. In contrast to S-mode, there is no need to create individual connections (group addresses) in the tool. The devices establish connections autonomously.

Definitions

To make this possible, the following conditions must be fulfilled:

- Every device or subdevice is located within a zone.
- Every data point (input or output) is assigned to a zone.
- Every data point (input or output) has a precisely defined "name".

Whenever an output and input, with the same name, is located in the same zone, a connection is established automatically, as shown in the following diagram.

Engineering and commissioning

- For a detailed description of KNX (topology, bus supply, function and setting of LTE zones, filter tables, etc.), see "Communication using the KNX bus for Synco 700, 900 and RXB/RXL, Basic Documentation" [6].
- LTE mode data points and settings are described in the Synco Application Manual [12].
- To engineer and commission a specific system, use the Synco700 planning and commissioning protocol (XLS table in HIT, [7]).

3.11.3 Zone addressing in LTE mode (in conjunction with Synco)

In cases where RDF800KN../RDF800KN/VB/RDD810KN.. KNX room thermostats are used in LTE mode (e.g. in conjunction with Synco), zone addresses need to be allocated.

Depending on the application, the following zone address must be defined together with the Synco devices at the planning stage.

Short description	Factory setting	Parameter
Geographical zone (apartment)	(out of service)	P82
Geographical zone (room)	1	P83
Heat distr zone heating coil	1	P84
Refr distr zone cooling coil	1	P85

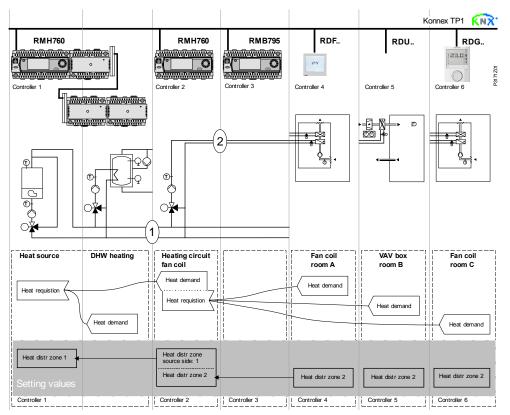

- Notes:
- The "Subzone" of the "Geographical zone" is fixed to 1 (not adjustable).
 - The device will send and receive LTE communication signals only if the zone address is valid (not OSV = out of service).

The zones to be defined are as follows:

Geographical zone (space zone) (Apartment . Room. Subzone)	Zone in which an RDF800KN/RDF800KN/VB/RDD810KN KNX room thermostat is physically located. Other room-specific devices may also be located in this zone.			
Apartment =, 1126 Room =, 163 Subzone = fix 1	Information exchanged in this zone is related specifically to the device's operating mode, setpoints, room temperature, and so on.			
	While the designations "Apartment" and "Subzone" do not need to be taken literally, "Room" really does refer to a room. For example, Apartment can be used to refer to a group of rooms, floor or section of a building. Subzone is not used for HVAC devices. It is better suited for other disciplines, such as lighting. Subzone is fixed to "1" and not visible.			
	The time switch information is expected from the same zone where the thermostat is located (Residential). If no time switch information is received from the same zone, the thermostat uses the information it received from the same apartment but with room "1" A.1.1 (Office).			
	Example: Commercial building In a commercial building, the time switch information is sent by the RMB795B central control unit. The zones are divided into "Room groups" (e.g. 14), where each "Room group" can have an individual schedule. A room thermostat in the same "Room group" must have the same apartment address. Legend: D = device address (P81) G = geographical zone (P82, P83) (Apartment.Room.Subzone)			
Heat distribution zone heating coil Zone =, 131	Information related specifically to the hot water system in heating coils is exchanged within this zone. The zone also includes a Synco device to process the information (e.g. RMH7xx or RMU7xx with changeover).			
Refrigeration distributionzone cooling coilZone=, 131	Information related specifically to the chilled water system is exchanged within this zone (e.g. cooling demand). This zone also includes a Synco device to process the information (e.g. RMU7xx).			
Outdoor temperature zone	The outdoor temperature is provided via KNX bus on zone 31. If available, it is displayed when the INFO page is selected			
Zone = fixed to 31				

3.11.4 Example of heating and cooling demand zone

The building is equipped with Synco controls on the generation side and with RDF../RDU../RDG.. room thermostats on the room side.

Explanation relating to the above illustration

In typical applications, the individual RDF./RDU./RDG.. room thermostats send their heat demand directly to the primary controller (in the above example to the RMH760).

- 0 and 2 designate the numbers of the distribution zone.
- Notes:
- This type of application can analogously be applied to refrigeration distribution • zones.
 - If no 2-pipe fan coil unit is used, heat and refrigeration demand signals are sent simultaneously to the primary plant.

3.11.5 Send heartbeat and receive timeout

In a KNX network, S-mode and LTE mode communication objects can be exchanged between individual devices. The Receive timeout defines the period of time within which all the communication objects requested from a device is received at least once. If a communication object is not received within this period, a predefined value is used.

Similarly, the Send heartbeat defines the period of time within which all the communication objects requested must be transmitted at least once.

LTE mode/S-mode Fixed times are specified as follows:

- Receive timeout: 31 minutes
- Send heartbeat: 15 minutes

Object [KNX obj. Nr.]	I/O	Minutes	Default value
Room operating mode: Time switch [12]	Receive	31	Comfort
Room operating mode: Preselection [7]	Receive	31	Auto
Application mode [31]	Receive	31	Auto

Reducing the bus load Individual zones can also be disabled (out of service) using a control parameter if they are not required. In disabled zones, the LTE signal is no longer periodically sent, and therefore reduce bus load.

3.11.6 Startup

Startup response The application is restarted after every reset, so that all the connected motorized valve actuators are synchronized (see section 3.7.

 Startup delay
 After a reset, it takes approximately 5 minutes for all the connected room
thermostats to restart. This avoids overloading the mains power supply because
restarting is avoided. At the same time, the load on the KNX network is reduced, as
not all thermostats transmit data at the same time. The delay (T_{WaitDevice}) is
determined by the thermostat's device address. After the delay, the device starts to
send.

3.11.7 Heating and cooling demand

In conjunction with Synco, the heating and/or cooling demand from each room is transmitted to the BACS to provide the required heating or cooling energy. An example for LTE mode is described in section 3.11.4.

In S-mode, the current state signals of the control outputs are available.

3.11.8 Fault function on KNX

If a fault occurs (e.g. digital fault input, dew point, or communication configuration) then a fault signal is sent via the bus.

An RDF800KN../RDF800KN/VB/RDD810KN.. room thermostat listens on the bus and sends its fault signal when the fault has the highest alarm priority. This ensures that the management station (BACS) does not miss any alarms.

If several alarms occur at the same time, the alarm with the highest priority is displayed first and is sent via the bus.

Fault transmission is different in LTE mode and S-mode:

S-mode	LTE mode
Fault state	Alarm information (error code + internal information)
Fault information (internal information)	Alarm text (default text can be edited with ACS tool)

The table below shows the error code and default alarm texts.

		Thermostat	Fault inform	nation on the bus	
Priority	Fault/service	Display	Error code	Default fault text	Text adjustable*)
-	No fault		0	No fault	✓
1	Bus power supply**)	ABUS	5000	No bus power supply	
2	Device address error	🐥 ADR	6001	> 1 id device address	
3	Condensation	♣ CON	4930	Condensation	✓
4	External fault input X1	AL1	9001	Fault input 1	✓
5	External fault input X2	AL2	9002	Fault input 2	✓
6	Clean filter reminder	🐥 FIL	3911	Dirty filter	1

^{*)} Default alarm texts are stored in the thermostat's non-volatile memory and can be adjusted using the ACS tool.

^{**)} This error will not be sent via the bus (because there is either no bus, not sufficient bus power supply, the bus is overloaded or the bus signal is distorted).

• External faults 4...5. If faults are active, AL1 and AL2 display alternately. Only

Priority of alarms

A supervisory alarm system may command the thermostat to stop sending fault signals to the bus using the communication object "Fault transmission" (disable/enable).

the fault with the highest priority will be sent via the bus.

This has no impact on the local display of faults.

• Priority order is 1...6.

After a timeout of 48 hours, the forwarding of fault signals will automatically be enabled again.

Communication object to adjust the Economy cooling setpoint used by the thermostat (see section 3.3.2). It will directly change the value of P12.

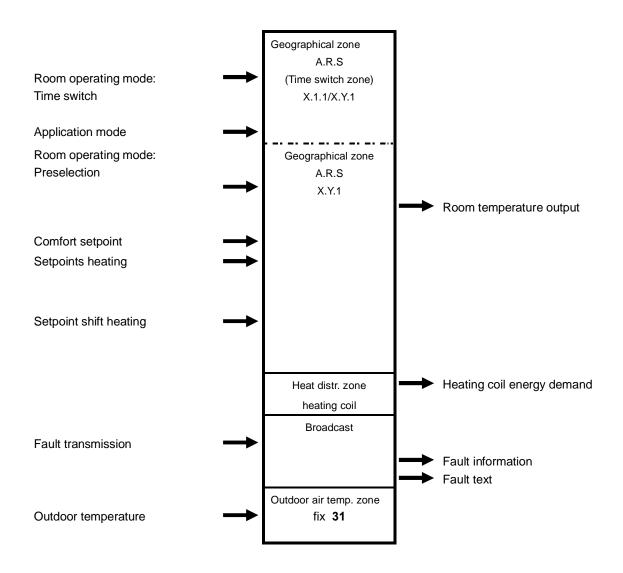

S-mode object must be enabled by setting "Room temp. : Economy setpoints" to "as group object.

The Economy setpoints to as group object. The Economy setpoint is stored in EEPROM. The service life of the EEPROM depends on the number of write cycles. Never write this communication object cyclically.

3.13 Communication objects (LTE mode) 3.13.1 RDF800KN.., RDF800KN/VB Overview

3.13.2 RDD810KN... Overview

3.14 Control parameters

A number of control parameters can be readjusted to optimize control performance. This can be done on the thermostat using the HMI, or the tool. These parameters can also be set during operation without opening the unit. In the event of a power failure, all control parameter settings are retained, see section 3.14.

The control parameters are assigned to one of the two levels:

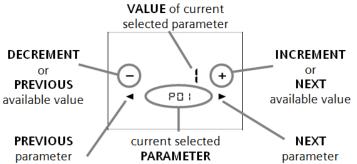

- Service level The Service level contains a small set of parameters to set up the thermostat for the HVAC system and to adjust the user interface. These parameters can be adjusted any time.
- Expert level including communications, diagnostics and test. At the Expert level, you must change the parameters carefully since they impact the thermostat's control performance and functionality.

	3.14.1 Setting parameters using the local HMI				
	Wake up the thermostat by touching the screen display.				
Entering the Service level	 Factory setting for the Service level password is 00 00. 1. Touch and hold down the ticon for 5 seconds. Then set the first 2-digit number to 00 using <!--▶.</li--> 				
	PRS PRS				
	2. Touch the last 2-digit number and set it to 00 using ◀/►. PRS I IIIIIIIIIIIIIIIIIIIIIIIIIIIIIIIIIII				
	3. After 3 seconds, P (successful login) or F (fail to login) is displayed.				
	 If the login failed, reenter the correct password as per step 1 above. After successful login, the first parameter is displayed as shown in the following example: 				
	- { + ∢ PO2 ►				
Notes:	 Touch any icon to exit. Touch To select any parameter and +/- to adjust values. When reaching END, touch END to exit. The password can be modified using the ACS tool. 				
Entering the Expert level	Follow the same steps for entering the Service level. Factory setting for Expert level password is 99 99 .				
Passwords setting	The "User level password" (P29) for entering the Service level and the "Installer level password" (P99) for entering the Expert level are not visible in the parameter list and cannot be modified by using the local HMI.				

Configuring parameters

ACS

After entering the correct password, the screen displays as follows. Touch $\triangleleft/\triangleright$ to advance or return to the desired parameter and use +/- to select the desired available value.

Refer to section 3.14.3 for Service level parameters; refer to section 3.14.4 for Expert level parameters.

Resetting parameters The factory setting for the control parameters can be reloaded using P71, by setting the value to **ON**. Refer to section 3.14.4 for P71. For power reset and so on, refer to Data Sheets CE1N3174 and CE1N3175.

3.14.2 Setting and downloading parameters using the tools

Control parameters can be adjusted using the bus, either by downloading them during commissioning or during normal operation with a tool.

With the ACS tool, the parameters can be changed during...

- commissioning by downloading all of them.
- normal operation using Popcard (most of the parameters).

 Passwords setting
 The "User level password" (P29) for entering the Service level and the "Installer level password" (P99) for entering the Expert level are only visible on the ACS tool. Both passwords can be modified in ACS or downloaded by using ETS.

 OZW772 web server, RMZ792-B bus operator unit.
 Most parameters can be changed during normal operation using either the OZW772 web server or the RMZ792-B bus operator unit.

 ETS
 ETS is an engineering tool that can be used for commissioning of the RDF800KN../RDF800KN/VB/RDD810KN.. KNX room thermostats. Device address and application, and control parameters can be defined and downloaded using ETS.

 Refer to section 5.1.1 for ETS programming mode

Note: Parameter settings on the RDF800KN./RDF800KN/VB/RDD810KN.. KNX room thermostats are only supported by ETS4 and ACS version 8.28 or higher.

Connecting a KNX tool The connection of a KNX commissioning or operating tool to the RDF800KN./RDF800KN/VB/RDD810KN.. KNX room thermostats is described in section 4.2.

Parameter	Name Service level	Factory setting	Range	RDD810KN	RDF800KN, RDF800KN/VB	Dependencies

³⁾ This parameter can only be exited when the setting is back at "---". Touch + and – simultaneously to exit.

4. Handling

4.1 Mounting and installation

Mount the room thermostat on the conduit box. Do not mount on a wall in niches or between bookshelves, behind curtains, above or near heat sources, or exposed to direct solar radiation. Mount it approximately 1.5 m above the floor.

4.2 Commissioning

Before powering up (only for RDF800KN.., RDF800KN/VB)

•

Before powering up, set the DIP switches for the desired application. Do one of the followings:

- For remote setup via the tools, set all DIP switches to OFF;
 - For local setup, set the DIP switches to select applications (see table below).

Commissioning method	DIP switches	LCD	Application
Remote setup	ON 1 2 3	APP NONE	-
	ON 1 2 3	APP 2P	2-pipe
	ON 1 2 3	APP 2PEH	2-pipe with electric heater
Local setup	ocal setup	APP 4P	4-pipe
	ON 1 2 3	APP 2P3P	2-pipe with 3-position output

After setting the DIP switches, complete the installation and power up the thermostat.

Note: As soon as the application is changed, the thermostat reloads the factory settings for all control parameters, except for the KNX device and the zone addresses!

Wizard

After setting the DIP switches (not required with RDD810KN...) and powering up the thermostat, the wizard function guides you through configuring the basic parameters for normal operation according to the table below.

- Touch </ > to advance/return to any parameter;
- Touch +/- to change values.

	LCD		Parameter	Range	Factory setting
-	 PO 1	+ ►	Control sequence (RDF800KN, RDF800KN/VB only)	0: Heating only 1: Cooling only 2: Manual changeover 3: Auto changeover 4: Heating and cooling	2-pipe = 1 4-pipe = 4
-) 209	+ ►	User operating mode profile	1: Comfort > Protection 2: Comfort > Economy > Protection	1
-	П РОЧ	+	Selection of °C or °F	0: °C 1: °F	0
-	0 P06	+ ►	Standard display	0: Room temperature 1: Setpoint	0
-	<mark>ו</mark> רסק	+ ►	Display info line (2 nd line of LCD)	0: (no display) 3: Time of day (12h) via bus 4: Time of day (24h) via bus	0

LCD	Parameter	Range	Factory setting
- [] + ≺ Pi5 ►	Fan speed in dead zone (RDF800KN, RDF800KN/VB only)	0: Fan OFF 1: Fan speed 1 H/C 2: Fan speed 1 Cool only	0
- ∃+ ∢ P38 ►	Functionality of X1	0: no function 1: Ext/return Temp (AI) 2: H/C changeover (AI/DI) 3: Window contact (DI) 4: Dew point sensor (DI)	3
- + ∢ P40 ►	Functionality of X2	 4: Dew point sensor (Di) 5: Enable electric heater (DI) 6: Fault input (DI) 7: Monitor input (digital) 8: Monitor input (temp) 10: Presence detection (DI) 	1
- ∏∏ + I < P39 ►	Operating action of X1	Normally open (NO)	Normally
- ∏∏ + ∢ P4 ; ►	Operating action of X2	Normally closed (NC)	open (NO)
■ EU9	-	End of wizard	-

For more information about parameters, see section 3.14.

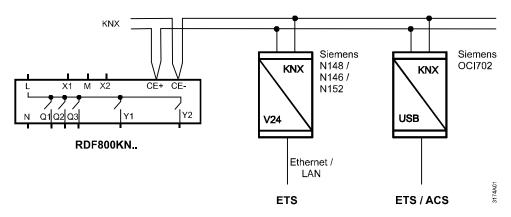

ResetTo reload the factory settings for all parameters, set P71 to ON. Restart the
thermostat after reset. All LCD segments flash, indicating that the reset is correct.
Three seconds later, the thermostat is ready for commissioning by qualified HVAC
personnel.

Applications The room thermostats are delivered with a fixed set of applications. Select and activate the required application during commissioning using one of the following tools:

- Local DIP switch and HMI
- Synco ACS
- ETS

Connecting tools

Connect the Synco ACS or ETS tool to the KNX bus cable at any point for commissioning. The following example applies to RDF800KN.., RDF800KN/VB:

ACS and ETS require one of the following interfaces:

- Ethernet/LAN KNX interface (e.g. Siemens N148, N146 or N152)
- OCI702 USB-KNX interface

Note:	An external KNX bus power supply is required if an RDF800KN/RDF800KN/VB/RDD810KN KNX room thermostat is connected directly to a tool (ACS or ETS) using KNX interface.					
Control parameters	 The thermostat's control parameters can be set to ensure optimum performance of the entire system. The parameters can be adjusted using Local HMI Synco ACS ETS The control parameters of the thermostat can be set to ensure optimum 					
	performance of the entire system (see section 3.	14).				
Control sequence (for RDF800KN,	 Depending on the application, the control see P01. The factory setting is as follows: 	quence may need to be set via				
RDF800KN/VB only)	Application	Factory setting P01				
	2-pipe and chilled/heated ceiling	1 = cooling only				
	4-pipe, chilled ceiling and radiator	4 = heating and cooling				
Compressor-based applications (for RDF800KN, RDF800KN/VB only) Calibrating the sensor (P05)	 When the thermostat is used in connection with a compressor, adjust the minimum output on-time (P48) and off-time (P49) for Y1/Y2 to avoid damaging the compressor or shortening its life due to frequent switching. Recalibrate the temperature sensor (built-in or external) if the room temperature displayed on the thermostat does not match the room temperature measured 					
	(after min. 1 hour of operation). To do this, change P05.					
Setpoint and range limitation	 We recommend to review the setpoints and setpoint ranges (parameters for RDF800KN, RDF800KN/VB: P08P12; for RDD810KN: P08P11) and change them as needed to achieve maximum comfort and to save energy. 					
Programming mode	The programming mode helps identify the therm commissioning.	C C				
	Touch and hold down the Oicon for more than programming mode, which is indicated by the di- remains active until thermostat identification is c	splay of Pr09 . Programming mode				
	Pr 09					
Assigning KNX device	Assign device address (P81) using the HMI, ACS or ETS tool.					
address	When the device address is set to 255, communication is deactivated (no exchange of process data).					
Assigning KNX group addresses	Use ETS to assign the KNX group addresses of objects.	the thermostat's communication				
KNX serial number	Each device has a unique KNX serial number inside the front panel. An additional sticker with the same KNX serial number is enclosed in the packaging box. This sticker is intended for installers for documentation purposes.					

4.3 Operation

The following pages can be displayed by touching the 🌣 icon, depending on priority: alarm/service reminder, manual H/C changeover, basic Information about room and outdoor temperature.

See the previous sections in this document for the following operations: temperature setpoints, fan speed, operating modes, parameter mode, programming mode, etc.

4.3.1 Alarm/Service reminder

If any alarm is displayed (\clubsuit), touch the \clubsuit icon to check the alarm or service reminder.

If there is more than one alarm, use ◄/► to browse through all active alarms

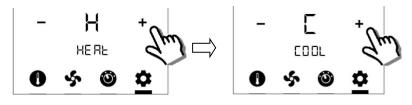

The following table describes the detail information for all alarms and services.

Priority	Alarm/service	Display	Error code	Туре
1	Bus power supply	BUS	5000	Fault
2	Device address error	ADR	6001	
3	Condensation	CON	4930	
4	Ext fault input 1	AL1	9001	
5	Ext fault input 2	AL2	9002	
6	Clean filter reminder (+/- to remove reminder)	FIL	3911	Service

4.3.2 Heating/cooling manual changeover (RDF800KN.., RDF800KN/VB only)

If manual heating/cooling changeover is set using P01 = 2, touch the \clubsuit icon once or twice (depending on the alarms) to select heating or cooling mode.

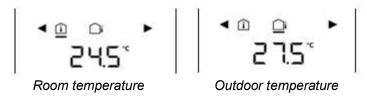

The selected control sequence will start in three seconds.

The ${}^{igodold n}$ icon is displayed when manual heating/cooling changeover is enabled.

This INFO page provides information about room temperature ($\widehat{\square}$) and outdoor temperature ($\widehat{\square}$), if available from the KNX bus.

If there is no active alarm or manual heating or cooling changeover is disabled, (P01 \neq 2), only the INFO page displays.

4.4 Remote operation

The RDF800KN../RDF800KN/VB/RDD810KN.. KNX room thermostats can be operated from a remote location using the OZW772 web server, a RMZ792-B bus operating unit or the ACS tool.

4.5 Disposal

The device is considered electrical and electronic equipment for disposal in terms of the applicable European Directive and may not be disposed of as domestic garbage.

- Dispose of the device through channels provided for this purpose.
- Comply with all local and currently applicable laws and regulations.

5. Supported KNX tools

5.1 ETS

ETS is an engineering tool and is used to fully commission the RDF800KN./RDF800KN/VB/RDD810KN.. KNX room thermostats.

ETS can implement the following functions:

- Define and download the physical address
- Define and download the application (plant type, control sequence)
- Set up and download the thermostat's control parameters
- Set up and download group addresses

This document does not describe how to operate ETS and how to set up a device. Refer to the KNX Manual [4] for more details.

Note!

Setting RDF800KN../RDF800KN/VB/RDD810KN.. KNX is only supported by ETS. ETS can be updated online.

5.1.1 Commissioning – downloading using ETS

1.	Set the DIP switches to OFF (remote configuration) before snapping the front panel to the mounting plate (RDF800KN, RDF800KN/VB only)	ON 1 2 3
2.	When the thermostat is powered up initially, the display on the right side indicates that no application is downloaded or has been selected before.	RPP nane
3.	Touch and hold the i con for more than 5 seconds to activate programming mode. The display on the right side indicates that the thermostat is ready for downloading the address and the applications.	∏ Pr 09
4.	Touch ON to exit.	Note: Each time the application is changed, the thermostat reloads the factory settings for all control parameters, except for KNX device and zone addresses.

5.1.2 Parameter settings in ETS

- 1. Open the project in ETS and select a device.
- 2. Click **Parameters** tab, and adjust the control parameters as follows:

Device Room Operating Mode	[DIP] Plant type	2-pipe	•
Room Temperature Setpoints Controller	[P01] Control Sequence	Cooling only	•
Fan			
Inputs	[P02] Operation via room op selector	Auto - Protection	•
	[P04] Unit	Degrees Celsius	•
	[P06] Standard display	Room temperature	•
	[P07] Additional display information		•
	[P14] Keypad	Unlocked	•
	[P16] Buzzer	Enable	•
	[P68] Temporary comfort mode [minutes]	0	•
	Passwords		
	[P29] Service level	0	
	[P99] Expert level	9999	

- The Plant type (application), Control Sequence and other control parameters ([Pxx] description) can be downloaded. For more details on control parameters, see section 3.14.
- **Notes:** ETS4 or higher versions is used to assign the communication objects to group addresses (S-mode)
 - ETS4 or higher versions is used to download the application and parameters
 - New password values (P29 and P99) for entering into the Service and Expert level can be downloaded.

5.2 ACS

ACS

The RDF800KN../RDF800KN/VB/RDD810KN.. KNX room thermostats can be commissioned (physical address, application, and parameters) by using the ACS tool. They can also be operated or monitored via bus during normal operation.

This section does not describe how the physical address is defined and only provides a brief overview of ACS' main functionality.

For more information, refer to ACS online help.

•) Note!

Setting RDF800KN../RDF800KN/VB/RDD810KN.. KNX parameters is only supported by ACS version 8.28 or higher.

5.2.1 Parameter settings in ACS

In the ACS program, select Plant → Open to open the plant. To start the parameter settings, select Applications → Plant engineering.

Parameter settings in ACS

The ACS tool supports parameter settings even during normal operation.

To change a control parameter, double click the parameter under **Standard popcard** to make the settings.

- Notes: Make sure you have logged on with sufficient access right.
 - Only control parameters can be changed, not applications!

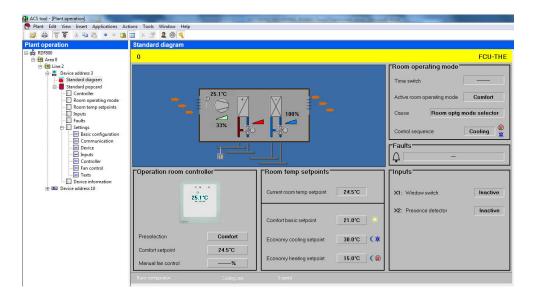

Plant diagram in ACS

The ACS tool offers plant diagrams for easy monitoring and operation of the thermostat.

To start this application, select **Applications** \rightarrow **Plant operation** \rightarrow **Standard diagram**.

79/94

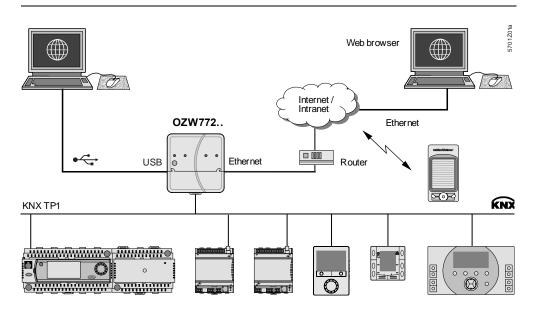

The ACS tool provides standard plant diagrams for RDF800KN./RDF800KN/VB/RDD810KN.. KNX room thermostats, depending on the following configurations:

Plant type	Application Configuration	Application Configuration
2-pipe	2-pipe fan coil unit – Control sequence: No impact (P01 = any) – Fan operation: Not disabled (P52 <> 0)	Radiator – Control sequence: Heating only (P01 = 0) – Fan operation: Disabled (P52 = 0)
	Chilled/heated ceiling- Control sequence: Changeover (P01 = 2,3)- Fan operation: Disabled(P52 = 0)	Chilled ceiling- Control sequence: Cooling only (P01 = 1)- Fan operation: Disabled(P52 = 0)
2-pipe and	2-pipe fan coil unit with electric heater	Single stage with electric heater
electric heater	 Control sequence: No impact (P01 = any) Fan operation: Not disabled (P52 <> 0) 	 Control sequence: No impact (P01 =any) Fan operation: Disabled (P52 = 0)
4-pipe	4-pipe fan coil unit	Chilled ceiling with radiator
	– Control sequence: Not auto c/o (P01 <> 3)	 Control sequence: No impact (P01 = any)

Plant type	Application Configuration	Application Configuration
	– Fan operation: Not disabled (P52 <> 0)	– Fan operation: Disabled (P52 = 0)
	Fan coil unit main/secondary	Main/secondary
	 Control sequence: Auto c/o (P01 = 3) Fan operation: Not disabled (P52 <> 0) 	 Control sequence: Auto c/o (P01 = 3) Fan operation: Disabled (P52 = 0)
Heating only	– Floor heating limit temperature (P51=OFF)	– Floor heating limit temperature (P51≠OFF)
	0% 27.2°C	

5.2.3 Operation and monitoring with OZW772 web server

SIEMENS

HomeControl app for plant control The OZW772 web server enables you to operate a Synco HVAC system from a remote location (computer or smartphone) – using the HomeControl app.

The start page shows the most important data points. Navigating through menus and paths enables you to access all data points quickly and correctly. The entire installation can be visualized in the form of plant diagrams. Alarm and state messages can be forwarded to different message receivers, such as e-mail, or SMS, etc.

For details, see Commissioning Instructions CE1C5701.

5.2.4 Operation and monitoring with RMZ792-B bus operator unit

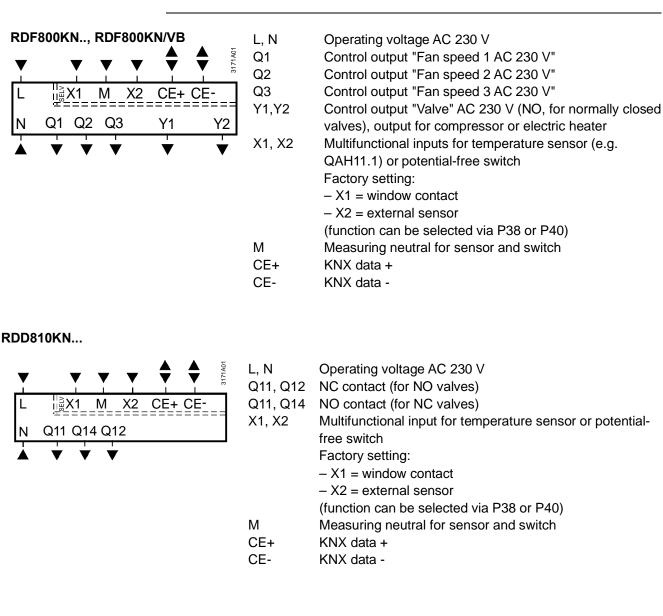

The RMZ792-B is a communicating bus operator unit designed for operating Synco[™] 700 and RDF KNX devices in a KNX network. It is suited for both fixed installation and mobile use (e.g. for use by the service engineer). It does not operate with third-party devices.

For details, see Basic Documentation CE1P3113.

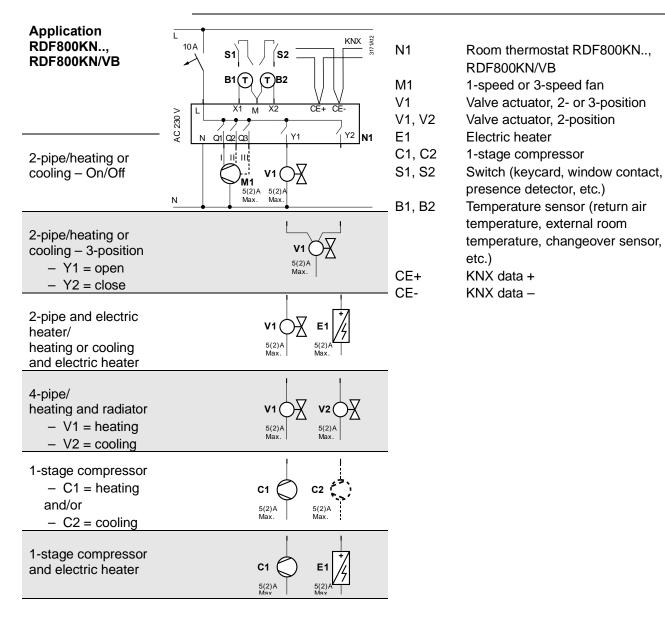

- **Note:** The application cannot be displayed in the form of text, instead a number is used: (Parameter **Plant type** on **Basic setting** menu):
 - 0 = no application 1 = 2-pipe 2 = 2-pipe and electric heater 4 = 4-pipe

6. Connection

etc.)	
Temperature sensor (return air temperature, exter	nal
room temperature, changeover sensor, etc.)	
KNX data +	
KNX data –	

Mechanical design 7.

7.1 General

The thermostats consist of two parts:

- · Front panel with electronics, operating elements and built-in room temperature sensor.
- Mounting base with power electronics. ٠

Note: RDF800KN/NF and RDD810KN/NF require additional mounting frames to complete the installation and are only suitable for square conduit boxes (confirming to BS 4662 standard).

> RDF800KN/RDD810KN is suitable for round conduit boxes (conforming to CEE/VDE), or square conduit box (confirming to BS 4662 standard).

Terminals		Description
RDD810KN	RDF800KN/NF	Description
L, N	L, N	AC 230 V power supply mains and neutral
-	Y1, Y2	Relay outputs 1 and 2
-	Q1, Q2, Q3	Low, medium and high speed, fan relay outputs
Q11	-	Relay input (dry contacts)
Q12	-	Relay, normally closed output (NC)
Q14	-	Relay, normally open output (NO)
X1/X2	X1/X2	Universal inputs 1 and 2
М	М	Input reference ground
CE+, CE-	CE+, CE-	KNX bus + and - terminals

The rear of the mounting base carries the screw terminals as follows:

The front panel of the thermostat can be plugged into the mounting base directly.

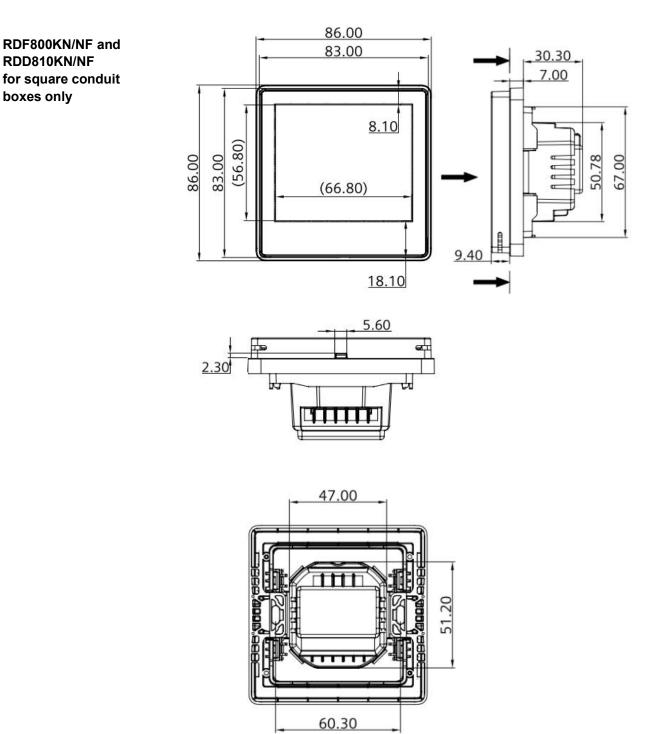

RDF800KN.., RDF800KN/VB front panel

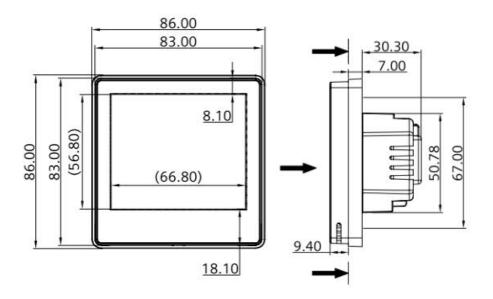

RDD810KN... front panel
